ABSTRACT

Several aspects of requirement for the driving safety must include human visibility such as luminance that has to be pinpoint acutely. Indefinitely, the study outcomes are to predict model of drivers' speed behaviour using Automobile Driving Simulator (ADS) with regard to human visibility aspects and to evaluate differences in intensity of lighting for photopic and mesopic visions. The objectives of the study are to assess and to compare the mean speed of the drivers (age group and gender) with photopic and mesopic visions at two lanes rural road curvatures, to investigate the significant relationship between the drivers' mean speed based on their age group and gender under photopic and mesopic visions at two lanes rural road curvatures, to develop several models of operating speed at the rural road curvatures with regard to the geometrical elements, age group, gender, photopic and mesopic visions. This study also aims to validate the proposed developed operating speed model of ADS to check the effectiveness and the reliability of the models. A total of 80 subjects with a valid driving license were recruited and divided into two groups: (1) young drivers (40 subjects, aged between 17 and 25 years old, with less than 10 years of driving experience) and (2) mature drivers (40 subjects, aged from 30 to 45 years old, with 10 years of driving experience or above). Each subject was required to drive in the driving simulator under photopic (260 cd/m²) and mesopic (0.25 cd/m²) visions where the level of both visions were yielded from average intensity of lighting which was measured by Luminance Meter at the actual site location. The mean speed of the drivers was compared to find the significant relationship. Multiple linear regression analysis was used to develop a statistical relationship between the related parameters. In the validation stage, the empirical data was compared with the predicted data using the paired T-test statistic and discrepancy measure such as Root Mean Squared Error (RMSE), Mean Absolute Error (MAE), and Mean Absolute Percentage Error (MAPE). From the results, the mean speed of young drivers (male and female) recorded is higher than the mean speed of mature drivers (male and female) for all curvatures under both photopic and mesopic visions. However, at certain point in the curvatures (point V_1), young female drivers were reported to drive faster than mature male drivers under mesopic vision. As can be confirmed, the young drivers (male and female) were more aggressive compared to the mature drivers (male and female) when driving in both photopic and mesopic visions. Moreover, the study successfully produced three models of the 85th percentile speed. The models predicted the 85th percentile speed at the middle of the horizontal curve (V_{85HMC}), at the middle of crest vertical curve (V_{85CMC}), and at the start of the sag vertical curve (V_{85SSC}) with regard to several related parameters. Those models have been successfully validated and sensitivity analysis was also well executed according to the established statistical procedures in the study. Therefore, this study is an endeavour towards the development of national standard for the operating speed model with regard to age group, gender, photopic and mesopic visions at the horizontal and vertical alignments of two lanes rural roads in Malaysia.

ACKNOWLEDGEMENT

In the name of Allah s.w.t, the Most Gracious and Most Merciful Alhamdulillah, all praises to Allah s.w.t for the strengths and His blessing in completing this thesis.

Special appreciation goes to my supervisor Dr. Muhammad Akram Adnan for his help and constant supports. His invaluable help by giving constructive comments and suggestions throughout the fieldwork, data analysis and thesis have contributed to the success of this research, not forgotten, my appreciation to my co-supervisor Prof. Dr. Chen Ai Hong, Dr. Kamaruzzaman Mohamad, and Assoc. Prof. Dr. Jezan Md Diah for their support, advice and their invaluable time to make this thesis possible. I would also like to express my thankful to Dr. Haryati Awang, Ir. Dr. Siti Nurbaya Abd Karim and Assoc. Prof. Dr. Jezan Md Diah for the knowledge regarding this topic, suggestions and thoughtful feedback during my defence research study.

I would like to extend my heartfelt acknowledgement to Mohd Khairul Afzan Bin Mohd Lazi, Mohammad Ashari Muda, Farhana Natasha Binti Mohamad, Rino Effendy B Abu Haris, Aisharini Binti Shaarani, Muhammad Haziq Bin Zaid, Mohamad Izwan Fahmy Bin Ismail and Khairul Anuar Bin Hamid, UiTM students for their cooperation and assistance during field investigation. I also would like to thank the individuals who were not mention here that took part for the data collection, especially for their dedication of long hours and attention towards the research work. Thanks to Dr. Tuan Badrol Hisham Tuan Besar, UiTM lecturer for his moral support, and thanks to Assoc. Prof. Mangalam A/P K.S Gopala Iyer, an expertise in Applied Statistics and Regression Analysis from Faculty of Computer and Mathematical Sciences, UiTM for their contribution on sharing knowledge in the statistics understanding.

Appreciation goes to Madam Hartine Awang and Mr. Mohd Akhbar Abdul Hamid, Mr. Mohd Hurman Abdul Ghani, and Mr. Norazuan Imam Mahadi, the laboratory technicians for sharing their extensive knowledge of the equipments and for the time they dedicated to provide accurate data for this study. The financial supports of Prototype Development Research Grant Scheme (PRGS), and Exploratory Research Grant Scheme (ERGS) from Ministry of Higher Education Malaysia (MOHE) are also appreciatively acknowledged.

Million words of thanks goes to my beloved family especially my father, Ab Rahim Mohammed, my mother, Noriah Bte Yusof, my wife, Nurul Hidayah Bte Abdullah and my son, Abdul Haqq and Abdul Adl who tirelessly encouraged and for their immense kindness, patience, and support.

Last but not least, to all those people who have helped me in one way or another and whose names was not mentioned here, I wish to say thank you and may Allah s.w.t bless you.
