ABSTRACT

In this study, organic corrosion inhibitor has been synthesized by using palm fatty acid distillate (PFAD), a by-product from processing of crude palm oil. The synthesized corrosion inhibitor contained mixture of fatty amides. However, this amide-based corrosion inhibitor was only effective in static condition and at room temperature (25°C). In real industrial applications, most of conditions are facing with moving fluid or elevated temperature conditions. One would expect that the corrosion activity is more vigorous in these kinds of conditions. This study introduced selected oxygen scavengers into the inhibited solution consisting of fatty amides. The main objective is to enhance the inhibition performance in static, different rotation speeds and in elevated temperatures. At the initial stage of work, different concentrations of fatty amides (10-200 ppm) were tested to obtain the inhibition efficiency. Then, one concentration of fatty amide would be combined with different concentrations of different selected oxygen scavengers, (500-2000 ppm) (sodium sulphite, hydrazine and diethyl hydroxylamine). The corrosion inhibition performances were determined through electrochemical tests; linear polarization resistance and electrochemical impedance spectroscopy. From the electrochemical tests, it showed that increasing the concentration of oxygen scavengers in the inhibited solution, the inhibition efficiency increased. However, it was an exception for combination of fatty amides with diethyl hydroxylamine. The mixture of fatty amides with sodium sulphite and mixture of fatty amides with hydrazine achieved high increment in the inhibition efficiency (IE) in static condition (25°C). Both mixtures were further tested in different temperatures (30, 40 and 50°C) and different rotation speeds (laminar, transition and turbulent). The mixtures showed that increasing concentrations of sodium sulphite/hydrazine, the IE increased. However, the IE decreased with increasing temperatures and with increasing rotation speeds for both mixtures. After that, the nature of the film formed on the specimen surface was analyzed by surface analysis including Scanning Electron Microscope-equipped with an Energy Disperse X-ray spectrometer (SEM-EDX), Atomic Force Microscope (AFM) and X-ray Photoelectron Spectroscopy (XPS). The finding showed that the inhibitors adsorbed on the specimen surface through physical adsorption according to the Langmuir isotherm. It can be concluded that the mixture of fatty amides with sodium sulphite is the best mixture to protect the metal surface of carbon steel through physical adsorption.

ACKNOWLEDGEMENT

In the name of Allah, the Most Gracious and the Most Merciful

Alhamduillah, all praises to Allah S.W.T for His guidance and blessing for giving me strength and ability to complete this study. First and foremost, my special appreciation goes to my superior supervisors Associate Professor Dr. Junaidah Jai, Associate Professor Md Amin Hashim and Dr. Muhammad Daud for their constant support and supervision. I'm gratefully praised for their invaluable help, encouragements, patience, numerous comments and suggestion during the process in completing this study.

I would like to express my appreciation to the Dean and the Deputy Deans, Faculty of Chemical Engineering for their support and help towards my postgraduate affairs. My acknowledgement is also goes to all the academic and non-academic staffs of Faculty of Chemical Engineering and Malaysian Nuclear Agency, Bangi for their cooperation during my journey in this study.

My special appreciation goes to my beloved parents, Mr. Ibrahim bin Mamat and Mrs. Zaidah binti Zakaria and also to family members for their tremendous support, prayers and encouragements. Their loves have always given me the strength to survive in facing any obstacles.

I would also like to extend my sincere thanks to all my friends especially Sxureha, Rafizah, Ezan Suhaila, Faridatul Akmal, Arman, Nazri, Hikmah, Noorfazlida, Nurul Fatin Alia, Zatul Iranati, Nurul Shuhada and all members of Postgraduate Room, Level 5 for their moral support and helps during my study. Thank you very much for the great memories.

To those who indirectly contributed in this research, your attention means a lot to me.

Thank you very much.
