ABSTRACT

Vitamin D, or the “sunshine” hormone became an attractable topic that recently captivates many researchers. The increased prevalence of vitamin D deficiency became an alarming health concern despite the accumulative evidence exploring its crucial role in various body organs. Type 2 diabetes mellitus (T2DM) is a major, progressive health condition that can lead to premature morbidity and mortality. The link between the risk of T2DM, insulin resistance and vitamin D deficiency has perplexed the medical society due to the controversy in the data available. Saudi Arabia (SA) is a sunny region, however ample amount of data reported the increased prevalence of vitamin D deficiency along with T2DM. This huge rise in SA found to be in concordance with the high global rate of both conditions. This study aimed to compare vitamin D deficiency between Saudi and non-Saudi nationalities, between healthy and T2DM patients. It aimed also to assess the possible associated factors for vitamin D deficiency and to study the impact of vitamin D supplementation on insulin resistance, and glycemic control on T2DM male patients living in Al-Madinah Al-Munawarah. This study consisted of three phases. Phase one and two were cross-sectional studies, while phase three was double-blind, randomized control trial. All phases were carried on the Medical Unit, Taibah University. A total of 193 participants were enrolled in this study. Results showed a significant increase in vitamin D deficiency in Saudi population compared to the non-Saudis ($P = 0.001$). A significant increase was also detected in vitamin D deficiency in T2DM patients than the non-diabetics ($P = 0.001$). In addition to, clinical improvement, which was observed among the intervention group in HOMA-IR (57%), FBG (50%) and HbA1c (50%). Meanwhile, no significant effect was seen in these parameters between the intervention and control groups after the administration of vitamin D supplementation 50,000 IU for 24 weeks to the intervention group. The occupation status and duration of diabetes was found to be associated with vitamin D deficiency in phase one and phase two. Insulin sensitivity, FBG and HbA1c were found to be associated with vitamin D status among the intervention group in phase three.

ACKNOWLEDGEMENT

الحمد لله الذي بنعمته تتم الصالحات Alhamdulillah

(Praise is to Allah, by Whose grace good deeds are accomplished)

Firstly, I wish to thank God for giving me the opportunity to embark on my PhD and for completing this long and challenging journey successfully. My gratitude and thanks go to my supervisor Dr. Bassam Abdurassol for his patience, guidance, as well as all the time he spent. I am truly grateful to him, who has been enthusiastically giving comments and encouraged me throughout this journey. I really have learnt the meaning of responsibility and care from him. Besides, I would like to express my appreciation towards Prof Yahya Hassan, Dr. Noordin Othman and Dr. Mahmathi Karuppannan and Prof Noorizan Binti Abdelaziz. Moreover, my thanks to all Pharmacy faculty members of Universiti Teknologi Mara (UiTM) specially to the respected dean Prof. Dr. Aishah Adam, Dr. Ibtisam Abdul Wahab and last but not least Mrs. Siti Haida Hj Abd Rahman and Mrs Marina Mohd Amin for their subordinate and help.

My appreciation goes to the lab staff and technicians in the Medical Administrative Unit, Taibah University who provided the facilities and assistance during sampling. Special thanks to the study physician for his help in this work.

Finally, this thesis is dedicated to the loving memory of my very dear mother and late father for the vision and determination to educate me, and to my beloved wife, daughter and son for their patience, tiredness and encouragement by which they provided me to complete this work. This piece of victory is dedicated to all of you. Alhamdulillah.

TABLE OF CONTENTS

	Page
CONFIRMATION BY PANEL OF EXAMINERS	ii
AUTHOR'S DECLARATION	iii
ABSTRACT	iv
ACKNOWLEDGEMENT	v
TABLE OF CONTENTS	vi
LIST OF TABLES	x
LIST OF FIGURES	xii
LIST OF ABBREVIATIONS	xiii
CHAPTER ONE INTRODUCTION	1
1.1 Background	1
1.1.1 Diabetes mellitus overview	1
1.1.2 Diabetes mellitus worldwide	3
1.1.3 Diabetes mellitus in the Middle East	3
1.1.4 Diabetes Mellitus in Saudi Arabia	4
1.1.5 Type 2 diabetes mellitus (T2DM)	6
1.1.6 Insulin	9
1.1.7 Vitamin D	14
1.1.8 Vitamin D and insulin resistance	26
1.2 Problem statement and research hypothesis	27
1.3 Research questions	28
1.4 The objectives of the research	29
1.4.1 General objective	29
1.4.2 Specific objectives	29
1.5 Significance and Strength of the study	29
CHAPTER TWO LITERATURE REVIEW	32
2.1 The association of vitamin D deficiency with the development and progression of T2DM	32

2.2	The role of vitamin D in Insulin Resistance (IR) and Type 2 Diabetes Mellitus (T2DM)	37
2.3	The correlation between vitamin D levels with micro- and macro-vascular complications	44
2.4	The impact of vitamin D Supplementation on glycated hemoglobin in T2DM	46
2.5	The prevalence of vitamin D deficiency among Saudi population	50
CHAPTER THREE METHODOLOGY		57
3.1	Study design	57
3.2	Study population	58
3.3	Sample size calculation	58
3.4	Study Flow Chart	61
3.5	Sampling criteria	62
	3.5.1 Inclusion criteria:	62
	3.5.2 Exclusion criteria:	62
3.6	Data collection	63
	3.6.1 Run-in period	63
	3.6.2 Active phase	64
	3.6.3 Laboratory Measurements	68
	3.6.4 Compliance	69
	3.6.5 Homeostasis Model Assessment (HOMA-IR)	70
	3.6.6 Randomization	71
3.7	Data analysis	72
3.8	Ethical consideration	73
CHAPTER FOUR RESULTS		74
4.1	Phase one: Prevalence of vitamin D deficiency between Saudis and non-Saudis	75
	4.1.1 The anthropometric profile of both groups	75
	4.1.2 Socio-demographic data for phase one	75
	4.1.3 Dietary habits for the Saudi and non-Saudi participants	77
	4.1.4 Duration and pattern of sun-light exposure among both groups in phase
