ACKNOWLEDGEMENTS

First of all, I do like to thank Allah S.W.T and His messenger, Prophet Muhammad S.A.W because with His permission, I have finished my final year project successfully. Many thanks to a great people who helped and supported me during doing this thesis especially my parents and family for their love and encouragement. My deepest thanks to my supervisor and co- supervisor, Prof. Madya Tahir Abas and Dr. Haji Mohd Zahari Abdullah @ Rafie. I am extremely grateful and indebted to both of them for their sincere and valuable guidance and encouragement extended to me. I would also like to thank the lab assistants of Faculty of Applied Sciences especially to Mr. Mohd Fauzi Bin Idrus for his help and encouragement. I would also like to thank my friends who directly and indirectly supported me during my project work, without the help of them this project would have not been possible.

Last but not least, this thesis will never be done without the guidance from the project coordinator, Dr. Aiza Binti Harun and other lecturers for their comments and tips. Thanks for your cooperation. Hope Allah S.W.T will bless all of you.

Mashitah Mustaffa Al Adlan

ABSTRACT

HEALTH RISK ASSESSMENT OF HEAVY METALS IN VARIOUS TYPES OF COMMERCIAL TEA BY TOTAL METAL ANALYSIS AND INFUSION

Most people simply drink tea frequently without knowing the presence of heavy metals in their beverages that might affect their health. The aims of this study are to determine and compare the heavy metals concentration of commercial tea in tea bag and loose tea and to investigate and compare the concentration of heavy metals between brands of tea. Three brands of black tea consist of loose tea and tea bag were bought at local market in Malaysia. The selected heavy metals studied are cadmium (Cd), chromium (Cr) and nickel (Ni). After digestion using dry ashing method and brewing tea, the sample were analyzed using by using PerkinElmer Graphite Furnace Atomic Absorption Spectroscopy (GFAAS). The highest concentration of the selected heavy metals are dominated by Cd (0.004 $\mu\text{g/g}$), followed by Ni (0.003 $\mu\text{g/g}$) and Cr (0.0023 $\mu\text{g/g}$). In tea bag also dominated by Cd (0.004 $\mu\text{g/g}$), followed by Cr (0.003 $\mu\text{g/g}$) and last is Ni (0.002 $\mu\text{g/g}$). In infusion method the amount of Cd in both types of tea are below detection limit. For Ni concentration in both type also below detection limit at certain brand. However Cr was detected at both type of tea and have lower concentration compared to Ni that present at certain brand of tea. Cr concentration in infusion powder tea is 0.01 $\mu\text{g/L}$, whereas in tea bag 0.13 $\mu\text{g/L}$. For Ni concentration in powder form is 0.86 $\mu\text{g/L}$ and in tea bag is 0.45 $\mu\text{g/L}$. The Hazard Index (HI) calculated shows that brand M was found to have highest value of HI, but by consuming of heavy metals present in tea does not pose any risk to human health.
