ABSTRACT

The presence of chloride ions accelerates the corrosion of aluminium in aqueous media; cause pitting attack. One way of protecting the aluminium is through coating with less reactive metal (i.e.:copper). Unfortunately, direct metallic coating on aluminium surface is hardly to carry out due to the presence of oxide layer. Thus, in this study, prior to copper coating, aluminium was pre-treated by cleaning, chemical etching and conversion coating (i.e.: zincating and nickel underlayer) in order to make copper coating process much easier. The effects of deposition temperature and pH solutions for conversion coating process were investigated. Meanwhile, for copper top coatings, the effect of electrodeposition modes were investigated by means of cyclic voltammetric (CV), chronoamperometric (CA) and chronopotentiometric (CP) technique in 0.1 M CuSO_4 + 0.1 M MSG + 0.01 M NaOH + 0.01 M $\text{C}_6\text{H}_5\text{Na}_3\text{O}_7 \cdot 2\text{H}_2\text{O}$ solution (pH 6) at 25°C. All coating samples were characterized using FESEM, EDX and XRD analysis. The adhesion strength of copper coating formed on the pre-treated aluminium was analyzed by Scotch[®] tape test. The corrosion resistance of aluminium coated with copper was analyzed by Tafel analysis and electrochemical impedance spectroscopy (EIS) in a corrosive medium of 3.5% NaCl solution. It has been proven that deposition temperature and pH of electrolyte solution was influenced the deposition of zinc on aluminium surface. The best zincating process on aluminium surface with grain-like microstructure morphology and the highest zinc composition (i.e.: 42.49 wt%) was done by immersing the aluminium substrate in 0.5M $\text{Zn}(\text{NO}_3)_2$ + 0.1M NaPH_2O_2 solution (pH 4) for 1hour at 50°C. Meanwhile, the deposition of nickel underlayer was performed by applying constant potential of -1.1 V from 0.1M NiSO_4 + 0.01 M NaOH + $\text{C}_6\text{H}_5\text{Na}_3\text{O}_7 \cdot 2\text{H}_2\text{O}$ solution (pH 6). It was also found that copper top coatings can be successfully coated on the nickel zincated Al surface either by CV (by cycling from -0.4 V to -0.9 V), CA (by applying constant potential of -0.7 V) or CP (by applying constant current density of -0.003 A/cm^2). All copper coatings prepared by different modes are strongly adhered to the modified aluminium surface with smooth and compact morphologies, higher copper composition with cubic crystalline structure. Nevertheless, copper coating prepared by CA mode showed the the highest corrosion protection efficiency (99.34%) of aluminium in chloride containing solution with the lowest corrosion rate (i.e: 0.002078 mm/yr) as measured by Tafel extrapolation method. The highest polarization resistance of $8877.2 \Omega \text{ cm}^2$ was determined by EIS analysis with 91.88% protective polarization resistance efficiency in 3.5% NaCl solution.

ACKNOWLEDGEMENT

Bismillahirrahmanirrahim,

Alhamdulillah, all praises to Allah for the strengths and His blessing in completing this thesis. Above all, I would like to thank Associate Professor Dr Yusairie Mohd, my principal supervisor for his help, support and guidance throughout this Master research. Special appreciation also goes to my co-supervisor, Dr Nor Zakiah Nor Hashim for her guidance and knowledge regarding this topic.

I would like to acknowledge the Universiti Teknologi MARA (UiTM) Shah Alam, especially Faculty of Applied Sciences for giving all equipments and good facilities. This gratitude also goes to Electrochemical Material and Sensor (EMaS) group. Other than that, I am also thankful to the dedicated laboratory staff Mr. Rozaini Harun, Mr. Hayub Ta and Mrs. Nida for their assistance on the FESEM and EDX handling, Mr. Abul Khamis for his assistance on XRD and all the staff.

I also would like to thank to The Ministry of Higher Education (Malaysia) for the financial support with Mybrain15 scholar and Fundamental Research Grant Scheme (FRGS) 600-RMI/FRGS 5/3 (139/2015).

I am extremely grateful to my friends, especially Dr Nik Norziehana Che Isa, Mohammad Aslam, Siti Sarah, Siti Safurah, Azreen Zakaria, Muhammad Aliff Haslan, Norina Rahim, Zahidah Othman, Monica Limau Jadam, Muizz Fahimi, Nor Azmi and Myzatul Akma for their friendship and full support throughout my journey to complete my study.

Finally, sincere thanks and appreciation go to my parents Mr. Mohd Zaki Hj Mohd Yasin and _____ for their prayers, unconditional support, encouragement and understanding. To those who indirectly contributed in this research, your kindness means a lot to me.
