ACKNOWLEDGEMENT

All praise to ALLAH S.W.T, Lord of the Universe, the Most Merciful who gave strength and ability to complete this thesis and Beneficent to Prophet Muhammad S.A.W and all the members of his family and his companion.

I would like to give a special appreciation to my lovely project supervisor, Puan Aida Sulinda Binti Kusim who devoted her time in giving me the guidance, suggestion, advice, support and positive idea in helping for the completion on my project. All the knowledge that has been given by her during this period will always be treasured.

Special thanks to my father Mohd Zain Zikri, for his motivation during the entire completion of the project. Not to forget to Mr Sallehudin, High Voltage Laboratory Technician, my lecturers and friends, mountain of gratitude and thanks for the undying support whether directly or indirectly throughout my course in UiTM especially during the time of completing the project.

Not to forget special thanks to both honorable panels, Ir Harizan for their comments, invaluable suggestions and outstanding deliberations on the improvement of project during the project presentation.

Last but not least, with all my love, I would like to dedicate this thesis especially to my late mom Safiah Binti Haji Saad and all my siblings for the supports and encouragement to produce the best work that I could.

Thank you all and May ALLAH blesses all of you.

Amir Razlan Bin Mohamad Zain

Malaysia.

ABSTRACT

The resistivity of soil or ground is one of the important factors to be considered when choosing for a suitable grounding spot or area. Problems may occur if the ground area around a facility is not suitable for grounding hence the need to move the grounding spot to an area far away from the facility that causes increase in the overall cost of installation. It is known that some parties involved in the grounding work uses salt treatment as a solution to this matter. This project aims to investigate whether this act of adding salt to grounding soil is a proper solution to the high resistivity of soil. Experiments were conducted where different concentrations of salt water which is also known as Sodium Chloride (NaCl) were poured onto a number of segments and the effects of NaCl on the soil resistivity were monitored for a period of 360 hours. It was found that NaCl addition successfully decreased the value of soil resistance but the effect is temporary and at the end of the monitoring period the value of resistivity has increased back to almost the original resistivity value.

Keywords — Soil Moisture, Ground Resistance, Salt Water (NaCl), Soil Resistivity, Salt Content, Earth Tester.
