ABSTRACT

Analysing the dynamic properties of a complex structure with a large number of substructures frequently leads the modal analysts to carefully select the appropriate methods for the optimal balance between the economics and accuracy of the analysis. The aim of this study was to investigate the capability of the wave-based substructuring (WBS) method in determining the dynamic behaviour of a structure having a large number of coupling interfaces of the substructures. The finite element method (FEM) and experimental modal analysis (EMA) were used for the investigation. Two different models of the structure which are full finite element (FE) and WBS based reduced order were developed and used for the determination of the natural frequencies and mode shapes of the structure. The measurement of the dynamic behaviour of the structure was carried out under free-free boundary conditions using an impact hammer and roving accelerometers. It was found that the recommended relative threshold value to be use for Singular Value Decomposition (SVD) in 2D modelling is $1e-5$ and $1e-6$ for 3D modelling. The comparisons of the results between the full FE, WBS method and test models revealed that the use of WBS method has led to a dramatic reduction in the expenditure of computational time by an average of 85% faster than the full FEM while still maintaining a satisfactory level of accuracy. This indicates that the WBS method can be used economically and efficiently for the determination of dynamic behaviour of a large complex structure with large size of interface nodes.

ACKNOWLEDGEMENT

I would like to express my gratitude to my primary supervisor, Dr. Muhamad Norhisham, for his valuable advice, encouragement and supervision throughout this research. I also would like to thank Ir. Dr. Mohd Azmi and Miss Liyana Roslan for their valuable input and time serving as my second and third supervisor.

Special thanks to Mr. Hazwan for his help in performing experimental work. Special appreciation to Mr. Fauzi for his readiness to fabricate the structure and his special attention to my project. I also would like to express my gratitude to former and present colleagues in the Structural Dynamics Analysis and Validation group, Mr. Wan Imaan Izhan and Mr. Mohamad Shamsul Azraf.

Finally, this thesis is dedicated to my loving parent, _____ and siblings for all their love moral support and patience. Without them, it would be impossible for me to complete my research.
