ABSTRACT

This paper presents a study on micro-Doppler characteristics of pedestrians using multiple-input multiple-output (MIMO) radar designed for automotive radar applications. The signals reflected might be similar in terms of reflecting angle and Doppler spread, between pedestrian and slow moving object. Hence, this study reports on the measurement and characterization of micro-Doppler signatures of the pedestrian in terms of Doppler spread contributed by multi-antenna measurement. The experiment is conducted in an anechoic chamber and laboratory, using continuous wave (CW) signal with the centre frequency of 4 GHz. A pair of ultra-wideband horn antenna is used as the radar sensors and positioned at different points along the baseline to produce pseudo-MIMO configurations. During the measurements, three types of targets are used – a moving object, a swinging ball and a pedestrian. Human target is studied in two motions, walking with swinging arms and walking without swinging arms. Results are analyzed using MATLAB software to generate corresponding Doppler spectrograms, Doppler histograms and Doppler spread analysis. The obtained results indicated the possibility of distinguishing micro-Doppler signatures between moving object and pedestrian by exploiting the difference in their Doppler spread information. Compared to single antenna configurations, wider Doppler spread is obtained when using MIMO configurations. Thus, outcomes from the MIMO configurations may help to improve the target classifications.

ACKNOWLEDGEMENT

First of all, I am greatly indebted to Allah SWT on His blessing to make this project succeed and completed in a proper way. I would like to gratitude and express my appreciations to all the organizations and individuals who have contributed the efforts either directly or indirectly right through my project. With the cooperation from all the parties, the objectives of the project are achieved precisely to the preferred result. Additionally, I would like to give an honoured thanks to my project supervisor, Dr. Idnin Pasya Ibrahim for the supervision with proper guidance and full of cooperation in any phase of the project especially in solving the problems that occurs during the project research. Besides, big thanks are dedicated to my project partner in this research, Tajmalludin Yaakob and technician for Microwave Laboratory, Encik Khalim for their guidance and helps during finishing this study.

Furthermore, I would like to thanks to my parents and family members who had supports me a lot all this year throughout the project with so much loves and cares in term of morals, financial and advices. Lastly, my appreciation goes to all my fellow links in this final year project especially those from Communication Department in Faculty of Electrical Engineering, Universiti Teknologi MARA Shah Alam. Their compliance in giving technical support and suggestions are valued upon the completion this work. This study is successfully done and all the objectives are achievable.

TABLE OF CONTENTS

AUTHOR'S DECLARATION	ii
ABSTRACT	iii
ACKNOWLEDGEMENT	iv
TABLE OF CONTENTS	v
LIST OF TABLES	vii
LIST OF FIGURES	viii
LIST OF ABBREVIATIONS AND GLOSSARY	x
CHAPTER 1: INTRODUCTION	
1.1 Background of Study	1
1.2 Problem Statement	5
1.3 Objectives	5
1.4 Scope and Limitation of Study	6
1.5 Significance of Study	6
1.6 Thesis Organization	6
CHAPTER 2: LITERATURE REVIEW	
2.1 Automotive Radar	8
2.2 Works Related to Improvement of Target Detection and Velocity Estimation	9
2.3 MIMO Radar Concept and Potential Applications in Automotive Sensors	11
CHAPTER 3: METHODOLOGY	
3.1 Flow Chart	13
3.1.1 Determine the MIMO Configurations	16
3.1.2 Experimental Setup	18
3.2 Comparison between Walking and Running Pedestrian on the Treadmill in the Anechoic Chamber	20
3.3 Comparison between Swinging Ball and Walking Pedestrian in the Anechoic Chamber	23

3.4	Comparison between Moving Object and Walking Pedestrian in the Laboratory	25
CHAPTER 4: RESULT AND DISCUSSION		
4.1	Introduction	27
4.2	Comparison between Walking and Running Pedestrian on the Treadmill in the Anechoic Chamber	29
4.3	Comparison between Swinging Ball and Walking Pedestrian in the Anechoic Chamber	32
4.4	Comparison between Moving Object and Walking Pedestrian in the Laboratory	36
4.5	Analysis of Doppler Spread	40
	4.5.1 Measurement in the Anechoic Chamber	40
	4.5.2 Measurement in the Laboratory	41
CHAPTER 5: CONCLUSION AND RECOMMENDATION		
5.1	Conclusion	45
5.2	Recommendation for Future Work	46
