ABSTRACT

Strobilanthes crispus is plant species from the family of Acanthaceae, known as 'pecah kaca' or 'jin batu' among Malaysian. *Strobilanthes crispus* is bush-like plants that is geographically distributed from Madagascar to Malay Archipelago. The *S. crispus* leaves are claimed to have anti-diabetic, diuretic, laxative, antimicrobial and wound healing properties which are usually used as traditional medicine by old folk. The study aimed to investigate the antimicrobial activity of *S. crispus* leaves aqueous extract and green biosynthesis Iron Oxide Nanoparticles (IONP) against tested human pathogens namely *Staphylococcus aureus*, *Escherichia coli*, *Bacillus cereus*, *Salmonella typhi*, *Candida albicans* and *Aspergillus niger*. The antimicrobial properties of *S. crispus* leaves aqueous extract and IONP was measured through the disc diffusion test. The inhibitory action of *S. crispus* leaves aqueous extract was only visible against *E. coli*; at 25 mg/ml with the mean diameter of zone inhibition was 7.3 ± 0.0167 mm and at 50 mg/ml with the mean diameter of inhibition zone of 8.7 ± 0.0167 mm. However, IONP was able to show better antimicrobial activity against all tested human pathogens compared to *S. crispus* leaves aqueous extract. The largest mean diameter zone of inhibition exhibited is 11.50 ± 0.288 mm and 9.00 ± 0.577 mm against *S. aureus* at concentration of 0.2 M and 0.3 M IONP. Protein leakage analysis assessed that IONP killing mechanism against tested human pathogens is by attacking the cell wall and membrane of bacterial and fungal cells. Then, the properties and structural of IONP was investigated through UV-Vis, SEM, XRD and FTIR method. Thus, from XRD analysis showed that IONP at concentration of 0.2 M and 0.3 M is orthorhombic and cubic shaped with chemical formula Fe_3O_4 . The crystal shape of IONP was observed through SEM. Also, FTIR method proved the formation of IONP as transmittance band was observed between 410 to 683 cm^{-1} that indicate the presence of metal-oxygen bond. In addition, absorption peak was observed between 280-400 nm that showed the presence of IONP through UV-Vis method. Hence, these data concluded that *S. crispus* leaves aqueous extract and IONP have antimicrobial properties against tested human pathogens to act as new potential antimicrobial agent in pharmaceutical industry.

ACKNOWLEDGEMENT

First and foremost, I would like to express my sincere gratitude to my supervisor that is Dr Wan Razarinah binti Wan Abdul Razak and my co supervisor that is Mr Helmy bin Yusof for the continuous support of my master research study, motivation, enthusiasm and knowledge. Their guidance helped me in all the time of research and writing of this thesis. I could not have imagined having a better supervisor for my master study.

Besides that, I would like to thank all the lab assistant for their cooperation and help in my master study. I especially would like to thank the lab assistant at postgraduate lab, microbiology lab, physics lab, chemistry lab, and SEM lab at Faculty of Applied Science, UiTM Shah Alam.

Other than that, my sincere thanks also goes to my fellow lab mates that help me during my lab work, giving me suggestions for my study and transportation for me to commute during pandemic Covid-19.

Last but not least, I am highly indebted to my beloved parents that is
and my siblings
and that help me a lot financially, mental support, providing comfortable place for me to write my thesis, and help me to overcome a lot of issue during my master study. This piece of victory is dedicated for my parents, the ones that keep me strong to finish this master study.
