**IMPLEMENTING GAME-BASED LEARNING
FOR TEACHING IMMUNE SYSTEM
MECHANISM WITH STRATEGY GENRE**

NURUL ATIKAH BINTI ARIFFIN KAMAL

BACHELOR OF COMPUTER SCIENCE (Hons.)

AUGUST 2023

ACKNOWLEDGEMENT

Alhamdulillah and praise to Allah SWT because with His Almighty blessings, I was able to finish this project report for this semester. I am deeply grateful and indebted with other supports to the successful completion for my Final Year Project.

First and foremost, I want to express my gratitude and special thanks to my supervisor, Fadzlin Binti Ahmadon, who has been monitoring and guiding me from beginning to end of my Final Year Project. Her advice and insightful remarks were really helpful to me while researching and preparing this report.

Aside from my supervisor, I'd want to thank my parents for their unwavering support and drive while I was composing this report. I am grateful to my family members for always encouraging me when I needed it the most.

I am particularly grateful to Dr Raihah binti Aminuddin, my CSP600 and CSP650 lecturer, for her assistance in providing suggestions and reviewing my report throughout the semester. She has provided me with great advice in the preparation of this report.

Finally, I'd want to thank my friends and classmates for sharing so much material with me and for devoting so much time to helping me write this report despite the fact that they are also working on their Final Year Project report and assignment.

ABSTRACT

The immune system, biology education, and game-based learning are all investigated in this study. The relevance of the immune system in infection defense is highlighted, as is the historical value of biology education in understanding living beings. With a focus on strategy games, game-based learning is suggested as an engaging and interactive technique. Traditional methods of learning, particularly in biology, lack engagement and rely on passive information communication. Without visualization, remembering scientific data, such as those about the immune system, can be difficult. This prevents students from obtaining thorough knowledge and effectively connecting concepts. Using a life cycle game development technique provides a systematic answer to the problems of traditional biology education. Game-Based Learning (GBL) can be effectively applied by following the phases of planning, designing, creating, testing, deploying, evaluating, and iterating. By producing a game prototype called Immune System, it assists students to educate and solves the lack of interactivity. Students can learn about the immune system in particular by using interactive features and graphic representations. The project's main result is was produced from System Usability Scale (SUS) questionnaire along with background questionnaire. The game manages to score 79.26 in SUS scale which landed on 'Good' phase. To conclude, the use of game-based learning education can assist other students in having more enjoyable ways of studying, which can increase their memory abilities and learning. Future work for the project is to improve the gameplay with animation and additional topic related with immune system.
