## **ACKNOWLEDGEMENTS**

We would like to express our heartfelt gratitude to the individuals who have supported and guided us throughout the completion of our final year project report at Universiti Teknologi MARA. Primarily, we extend our deepest appreciation to our supervisor, Dr. Maznah Banu Binti Md. Habiboo Raman, for her invaluable guidance and unwavering support. Her expertise, insightful feedback, and dedication have been instrumental in shaping the direction and quality of our project. We are profoundly grateful for her patience, understanding, and willingness to go beyond to assist us.

We would also like to thank Miss Nur Lina Binti Abdullah, our lecturer of MSP660, for her assistance and support in this project. Her expertise and insights have greatly contributed to our project's success, and we are grateful for her guidance. Furthermore, we want to express our appreciation to the faculty members of Universiti Teknologi MARA for providing an excellent academic environment and equipping us with the necessary knowledge and skills to undertake this project.

Additionally, we want to thank our friends and classmates for their constant support and encouragement. Lastly, we want to extend our deepest gratitude to our families for their unconditional love, understanding, and support throughout our academic journey. Although it is impossible to mention everyone who has contributed to this project, we want to convey our sincere thanks to every individual who has played a role, directly or indirectly.

This project would not have been possible without the support and guidance of all the individuals mentioned above. We are honoured to have had the opportunity to work on this project and are grateful for the knowledge and skills we have gained.

Thank you.

## **ABSTRACT**

Minimizing the cost is one of the main keys to gaining the highest profit. Thus, the main objective of this study is to build a linear programming model for small farms to represent the production of profit and maximize the profit using linear programming. The problem of palm oil production that will be solved by linear programming based on the general problem involves several variable costs such as fertilization costs, harvesting costs, insect and disease control costs, pruning costs and transportation cost. The results are obtained by using the Excel Solver, where the results are used to find the gross profit of palm oil production per year. Some conclusive observations have been drawn based on the report from the Excel Solver in determining the best value for cost minimization. This study will provide the small farmer of palm oil and other palm oil farmers with exposure to the linear programming method in making decisions to determine the optimization profit for difference costs.
