ABSTRACT

Finite difference method and Finite element method is known as numerical method to solve heat problem. It has been used widely in the real world, especially in the engineering field. The main goal of this research is to find the best method to solve 2D regular geometry heat transfer between Finite difference method (FDM) and Finite element method (FEM). The problem that has been used in this research is steady state heat transfer. MATLAB is used to computing whole calculation and plotting the temperature distribution graph. The result obtained recommend that Finite element method is the most accurate method to solve 2D steady-state heat problem since it has larger area of blue region in error distribution figure.

ACKNOWLEDGEMENT

First and foremost, I am grateful to Allah the Almighty for give me the patience and strength to finish my Final Year Project even in the beginning of this project there are a lot of obstacles that stall me from completing this project early and almost give up from this project. The support from surrounding also helped me along the process of this writing, and I would like to take opportunity to convey my gratitude to them.

I'd like to thank my supervisor, Sir Amiruddin bin Ab Aziz for his ongoing mentorship and significant support and insights that help me write this project. Despite the busy schedule, he always keeps my project on track. The guidance, patience and suggestions for improvement is very appreciated.

Lastly, I want to thank my family and friends who never stop encouraging me when I'm at low since day one.
