# Preface

It is with great pleasure that we present this extended abstract book, titled "The 5<sup>th</sup> Research Exhibition in Mathematics and Computer Sciences (REMACS 5.0)". This book is a collection of research work in the fields of Computer Science and Mathematics, contributed by the final year students from Universiti Teknologi MARA, Perlis Branch. The aim of this book is to showcase the diversity and depth of research in these two interrelated fields.

Mathematics and Computer Science are two fields that have seen tremendous growth and advancement in recent years. With the rise of new technologies and the increasing demand for data-driven solutions, researchers in these fields have been working hard to develop new theories, algorithms, and models that can help solve some of the most pressing problems of our time. This book is a testament to their hard work and dedication.

The abstracts in this book cover a wide range of topics, including algebra, analysis, logic, computer architecture, algorithms, artificial intelligence, machine learning, computer network, netcentric computing and many more. The work presented here is both theoretical and practical, and has the potential to impact many areas of society, from finance and healthcare to education and security.

We hope that this book will serve as a valuable resource for future students in the fields of Mathematics and Computer Science. We also hope that it will inspire more students to pursue innovative and groundbreaking research in these two fields. Finally, we would like to express our gratitude to all the contributors for their hard work and dedication, without which this book would not have been possible.

# REMOTE CONTROL DESKTOP SYSTEM

Muhammad Akmal Idran Hissamuddin and Ros Syamsul Hamid

College of Computing, Informatics and Media, Universiti Teknologi MARA Perlis Branch, Malaysia

## Abstract

A remote-control desktop system allows a user to access and control a computer remotely over a network connection. This can be done through various remote desktop software and protocols, such as Remote Desktop Protocol (RDP) or Virtual Network Computing (VNC). These systems are often used in scenarios where a user needs to access a computer remotely, such as for remote work or remote technical support. The system allows the user to access the desktop, files, and applications of the remote computer as if they were physically sitting in front of it. This can provide flexibility and convenience for users, as well as enabling remote collaboration and support. The security and performance of remote-control desktop systems can be a concern and requires proper configuration and maintenance. Therefore, the aim of this research is to design and develop a remote-control desktop system that can control in any device. The software development life cycle (SDLC) with waterfall model has been chosen as the methodology for this study. this model consists of five phases including analysis, design, implementation, testing and documentation. this research has achieved the objectives which are to design, develop and evaluate a remote-control desktop system with NodeJS and electrons.

*Keywords: Remote Control Desktop, NodeJS, Electron and WebSocket*

## 1. Introduction

Everyone can actual work from anywhere without being physically in the scene especially staff IT. Because they have a lot of things to recover the work. So, this project can help they work from home using remote control desktop software, which allows them to access their work computer as if they were physically sitting in front of it. This can be done through a variety of remote desktop software, such as Microsoft Remote Desktop, TeamViewer, and VNC. These programs use a combination of encryption and the internet to connect the employee's home computer to their work computer, allowing them to access and control the work computer remotely. The location of the scope element is at any department specified for IT Staff. In general, the system supports all devices that have a remote-control system which will be developed using NodeJS and Electron.

## 2. Methodology

Data were collected from participant observations, interviews, and textual analysis by referring to and evaluating existing concepts. Research findings evaluate the problem of the staff that been cause to them. For example, the staff it need to done two works or problem at the same time and solve it by physically in there. To solve the problem of the staff it needs a few tests to them about the remote control desktop so it can help the staff.

## 3. Results and Discussion

As the staff, what they have been through is tough to handle. To do multi task at the same time. It seen that this system can actual help them to reduce the time and energy. It can be done from anywhere, anytime and any devices. Staff IT can access their work computer from anywhere, which
