## **ABSTRACT**

The application of microstrip antennas has become popular because of various advantages such as lightweight, simplicity of fabrication and ease of mass production. Most of the design procedures currently employed in practice for designing microstrip patch antennas make use of the equivalent network models coupled with experimental iterations of the initial design. However, due to increasing interest in the use of microstrip antenna technology, computer software has been developed for accurate design of microstrip patches. One of these is 'Computer-Aided Design for Microstrip Antenna' (CADMS). Another software which also available is HPEESof LIBRA. In this project CADMS and LIBRA packages are used to design and analyse the rectangular microstrip antenna. The main objectives of this project are:

1. Study, analyse and design a rectangular patch antenna using CADMS and LIBRA techniques.
2. Study and implement the techniques of improving the bandwidth of the antenna.

## **ACKNOWLEDGEMENT**

**In the name of ALLAH s.w.t, the Merciful, the Beneficent, the Almighty One. Praised to HIM alone for HIS endowment that let me to complete this final year project.**

**I am pleased to acknowledge the considerable assistance, guidance and ideas of my project advisor, Dr. Riadh W. Y. Habash throughout the project duration. I also would like to thank Dr. Zaiki Awang for his technical support.**

**Also, thanks to all the staffs of Communication Laboratory and CADEM Center for their help during this project. Lastly, my sincere thanks to all my friends for their contribution to this project.**

## CONTENTS

Abstract	i
Acknowledgement	ii
Contents	iii

## CHAPTER 1

1.0	Microstrip Antenna	
1.1	General	1
1.2	Scope of Study	4

## CHAPTER 2

2.0	Microstrip Antenna Theory	
2.1	Introduction	5
2.2	Materials For Printed Circuit Antennas	5
2.3	Analysis Techniques For Microstrip Elements	
2.3.1	Transmission Line Model	7
2.3.2	Rectangular Patch	9
2.3.3	Wall Admittance of Rectangular Patch	19
2.3.4	Radiation Pattern of Rectangular Patch	20
2.4	Conductor and Dielectric Loss	22
2.5	Efficiency of Microstrip Elements	22
2.6	Quality Factor of A Microstrip Elements	24
2.7	Bandwidth of Single Patch Antenna	25

## CHAPTER 3

3.0	Design Procedure For Rectangular Microstrip Antennas	
3.1	Introduction	27

# CHAPTER 1

## 1.0 MIROSTRIP ANTENNA

### 1.1 General

Today, microstrip antenna is one of the most innovative topics in antenna technology. This trend is likely to continue as the characteristic of a microstrip antenna make them very appealing from a system perspective [1]. It is not the electrical characteristics of the basic microstrip antenna that has lead to this appeal, but rather its mechanical and fabrication features such as conformability and its easy integration with Microwave Integrated Circuits (MIC's). There are many different varieties of microstrip antennas, but their common feature is that they basically consists of four parts:

1. a very thin flat metallic region often called the *patch*
2. a *dielectric substrate*
3. a *ground plane*, which is usually much larger than the patch
4. a *feed*, which supplies the element rf power

A typical microstrip element is illustrated in Fig. 1. Microstrip elements are often made by etching the patch (and sometimes the feeding circuitry) from a single printed-circuit board clad with the conductor on both of its sides.

The longest dimension of the patch is typically about a third to a half of free space wavelength ( $\lambda_0$ ), while the dielectric thickness is usually in the range of  $0.003\lambda_0$  to  $0.05\lambda_0$ . A relative dielectric constant around 2.5 is typical. Sometimes a
