

**PRODUCTION OF HIGH FIBRE BISCUIT FROM OIL PALM PERICARP
FIBRE**

SITI HAJAR ISMAIL

**Final Year Project Report Submitted in
Partial Fulfillment of the Requirements for the
Degree of Bachelor of Science (Hon.) Food Science and Technology
in the Faculty of Applied Sciences
Universiti Teknologi MARA**

OCTOBER 2008

ACKNOWLEDGEMENT

In the name of Allah, the Most Beneficent, the Most Merciful. First and foremost, I would like to express my deepest gratitude and appreciation to my supervisor, Assoc. Prof Lee Hung Kiong for his support, guidance, encouragement and patience all the way for the beginning till the end of this project. Also to all lecturers in Food Science and Technology Programs for their support in this project.

Sincere thanks are also extended to the lab assistants who have assisted and guided me throughout the period of this project, especially Mrs. Nora, Mrs Siti Marhani, Miss Hariyah and Miss Shuhadah. Thanks also go to my classmates who are always around to lend me a hand and support throughout the duration of this project.

Last but not least, I also wish to give my highest appreciation, gratitude and love to those who has contributed their effort, financial support, motivation, and also for encouragement, patience and prayers which enable me to finish this project especially for my parents, Encik Ismail bin Ali and for their never-ending love and support.

Millions thanks to those who involve directly and indirectly for helping me to achieve the success of this final year project.

ABSTRACT

PRODUCTION OF HIGH FIBRE BISCUIT FROM OIL PALM PERICARP FIBRE

The oil palm pericarp fibre may provide potential alternative source of revenue for oil palm industries and the abundance of this raw materials lead to this study of incorporated it into the production of high fibre biscuit. The aims of this study were to evaluate the feasibility of producing high fibre biscuit from oil palm pericarp fibre that leads to an acceptable consumption. Toxicological analysis of BSLA was performed onto the raw material of oil palm pericarp fibre and also the finished product to determine the level of toxicant in different concentration was the major concern. In addition, the heavy metals were detected by using Atomic Absorption Spectrometry (AAS). Several other methods were used in these studies which was sensory evaluation, and also physical and chemical analysis. Physical analysis was to determine the fibre content in finished product through chemical analysis in order to obtain the high fibre claim on finished product. Statistical Package for the Social Sciences (SPSS) was used to analyze the sample by one way ANOVA and Duncan's to evaluate the significant different between formulations. In addition, the oil palm fibre can be incorporated into production of high fibre biscuit which was safe to be consuming with an improvement in the biscuit for better acceptability by the consumers.

CHAPTER 1

INTRODUCTION

1.1 Background and problem statement

Malaysia is the major producer of palm oil in the world. It produces 8.5 million tonnes per year of palm oil from fresh fruit bunches. Sabah's has the highest yield of oil palm fresh fruit bunch per hectare. Palm oil production generates large amounts of process residues such as fibre, shell and empty fruit bunches (EFB). In general, the fresh fruit bunch (FFB) contains (by weight) about 21% palm oil, 6–7% palm kernel, 14–15% fibre, 6–7% shell and 23% FFB.

Research into the utilization of oil palm empty fruit bunches has been active since 1954. Pulp suitable for certain paper products can be successfully produced. Utilization of EFB appears to be commercially and technologically feasible. It may also be highly desirable environmentally because it relieves the environmental impact of EFB, which is viewed as waste from the current oil production industry.

Almost 90% of the world palm oil production is used as food. This shows that the nutritional properties of palm oil and its fractions be adequately demonstrated. Oil palm fibers contain significant amounts of both water-soluble
