ACKNOWLEDGMENT

Alhamdulillah, I praise to Allah S.W.T.,the Most Greatest Creation. With His helps and blessing, this study has been done successfully. Praise is to our Prophet Muhammad S.A.W. who carried the light and peace throughout the universe.

Frankly speaking, I would like to express my sincere appreciation to my supervisor, Dr. Sadia Sultan for gave me an opportunity to do research and run this project under her. She always spending a lot for her time giving me advices, knowledge and guidance also for her kindness, supervision teaching and endless encouragement throughout this project.

A special thankful goes to my so-supervisor, Professor Dr. J.F.F. Weber Abdullah for his advices, knowledge and guidance throughout this project.

I am also be appreciate to the staff of iKUS especially who helps and discussing in dealing with chemicals, equipments, constructive advices and supervision during this project in iKUS laboratory.

Last but not least, I am mostly thankful to my beloved friends and family for their love and support which has indeed given me the strength and motivation to stay focused throughout completing this project.

ABSTRACT

3PR3 is an endophyte fungal that was use in this experiment for culturing with selected microorganisms (HAB10R12, *Red Actinomyces*, MB14, Seaweed and B20P). B20P discontinued from this experiment because contamination occurred even repeating three times. High Performance Liquid Chromatography (HPLC) is performed by eluting on silica-packed column under pressure; by pumping mobile phase acetonitrile (ACN). Up to 3mL/min, the column particle size packing material (stationary phase). Antimicrobial testing by using sample of *Escherichia coli* and *Candida albicans* were collected and recorded.

CHAPTER 1

INTRODUCTION

1.1 General Introduction

Natural products traditionally have participated as significant role in drug discovery and were the “root” of most early medicines. Over the last few years advances in alternative drug discovery methods such as rational drug design and combinatorial chemistry have placed great pressure upon natural product drug discovery programs and during this period most major pharmaceutical companies have ended or considerably scaled down their natural product operations. However, despite the promise of these alternative drug discovery methods, there is still a shortage of lead compounds progressing into clinical trials. This is especially the case in therapeutic areas such as oncology, immunosuppression, and metabolic diseases where natural products have played a central role in lead discovery (Butler, 2005).

Microorganism was can not live alone. Fungi are the decomposer and can obtain their own nutrients from other living organism. Their growth in influenced by humidity, sunlight, and heat. Disease causing microbes that have been resistant to drug therapy are an increasing public health problem. In spite of the availability of effective drugs and vaccines, the battle against infectious diseases is far from over. Not only they continue to cause a large number of infections and deaths, particularly in developing countries, but the emergence and spread of antimicrobial resistance is now threatening to
