ACKNOWLEDGEMENT

First and foremost my prayer and glory be to Aallah S.W.T the most merciful, for given me the strength and ability toward the completion of my final project paper entitle ' Ebngineered Wood I-joist from Keruing *Dipterocarpus spp.* flanges and Oriented Strand Board web. I'm also thank to my beloved friend for their continuous support.

I would also to offer my special thank to my advisor for thie final preject, En. Wan Mohd Nazri bin Wan Abd. Rahman for helping me at every phase of the study, who are so generous in leading me their helping hands and showing me the correct ways of performing my final project. I would like to express my most sincere thank to his

I also to extent my appellation to those who are involved either directly or indirectly in completing this project. I believe, without their helps I would not be able to complete this final project.

ENGINEERED WOOD I-JOIST FROM *Dipterocarpus ssp.* FLANGES AND ORIENTED STRANG BOARD (OSB) WEB

By

MOHD ROSDY BIN FAUZI

April 2001

I-joist component is using the system that involve the using of flanges Keruing and web from OSB. Both component are combined and must work together. The strength will be same with solid wood. The purpose of this testing is to test the strength of I-joist that made from the combination between solid wood as flanges and Oriented Strand Board (OSB) with L-shape as web. The sample of I-joist that have the highest modulus of rupture value was sample (KO-1) 28.38 MPa and the lowest modulus of rupture value was sample two (KO-2) with 21.04 MPa. Furthermore, the testing was to test the modulus of elasticity true. Test result shows the highest value was sample two (KO-2) with 15,988 MPa and the lowest modulus of elasticity value was sample (KO-3) with 10,826 MPa. As a conclusion to this study, flange and web components act together and perform as a system of I-joist.
