

**EVALUATION OF THE RIVER MANAGEMENT STATUS
IN INANAM LIKAS RIVER BASIN, SABAH**

NURSHAFRINA AIDA BINTI YAHYA

**Final Year Project Report Submitted in
Partial Fulfillment of the Requirements for the
Degree of Bachelor of Science (Hons.) Biology
in the Faculty of Applied Sciences
Universiti Teknologi MARA**

JANUARY 2016

ACKNOWLEDGEMENTS

In The Name of Allah, Most Gracious, Most Merciful

Assalamualaikum W.B.T

Alhamdulillah to Allah S.W.T that finally, with His blessings and permission as well as the cooperation from those who are involved in this final year project report, I am able to complete it. I would like to say thank you, especially my supervisor, En. Ajimi Bin Haji Jawan, for all the help, support, comments and guidance in helping me to finish this final year project report. Furthermore, I would like to say thank you to Miss Patricia Natin, my second checker and all other lecturers that provided me with comments and advices to improve my work.

Also not to be forgotten, I would also like to thank you to my parents for their encouragement and financial assistance which had helped me to go through all the obstacles and challenges throughout this research study.

Last but not least, thank you for all of my friends especially Herman Umbau Anak Lindang and Pengiran Muhammad Nazrin for the continuous help and support in completing my final year project report.

Nurshafrina Aida binti Yahya

ABSTRACT

EVALUATION OF THE RIVER MANAGEMENT STATUS IN INANAM LIKAS RIVER BASIN, SABAH

Phytoplankton are the main primary producers in freshwater and the abundance of this primary producer can cause different productivity level which determine the river health. Therefore, the productivity level can also be measured using Carlson's Trophic State Index (TSI). In this study, phytoplankton diversity and TSI are used to identify the productivity level thus evaluate the river basin management status in ILRB. The frequent used trophic state index classification is Carlson's Trophic State Index, while phytoplankton diversity are best using Shannon Weiner diversity index. 7 stations along ILRB were chosen for sampling station. For each stations, 3 replicate samples were collected between August to September 2015. Phytoplankton was collected using 20 µm phytoplankton net. The method in preservation and identification were recommended by APHA (2005). The Secchi Disk was used to determine the transparency while Hydrolab Multiparameter model DS5X was used to determine the chlorophyll *a*. The management status in ILRB is considered to be less effective because of the productivity level is high in both chlorophyll *a* (eutrophic) and transparency (hypereutrophic) indicated less effort in preventing algal bloom to occur and also water pollution, meanwhile, the phytoplankton diversity and phytoplankton species indicator (*Synedra ulna*, *Synedra acus*, *Cyclotella meneghiniana* and *Tabellaria fenestrata*) indicated that the ILRB was in mesotrophic state. The less contributions by stakeholders also causing the ILRB to be less effective in sustaining safe and clean water to consumers. Thus, both phytoplankton diversity and Trophic State Index can serve as an important tool in conservation of freshwater and more contribution towards sustaining good river basin management in ILRB is needed.
