SPECIFIC GRAVITY OF LUDAI (Sapium baccatum) ACCORDING TO HEIGHT LEVEL AND DISTANCE FROM PITH

By

AHMAD ZAKI MOHAMED HASHIM

Final Project Submitted in Partial Fulfillment For The Diploma In Wood Industries,

Faculty of Applied Science, University Teknologi MARA, Pahang, Branch.

September 2002

ACKNOWLEDGEMENT

I would like to express my deepest appreciation and sincere gratitude to my advisor Encik Amran Shafie for his unfailing help, support and guidance throughout the study.

Sincere thanks are also to all the staff and lecturers in Department of Wood Industries for their either directly or in directly help.

Finally, my deepest and special appreciation goes to my beloved friend for their moral support and guidance. May Allah S.W.T bless us all.

SPECIFIC GRAVITY OF LUDAI (Sapium baccatum) ACCORDING TO

HEIGHT LEVEL FROM DBH AND DISTANCE FROM PITH

By

Ahmad Zaki Mohamed Hashim

September 2002

ABSTRACT

Specific gravity (SG) of Ludai *(Sapium baccatum)* was determined using the water displacement method. The specimens used are from three different parts of the tree that is, base (DBH), middle (50% of clear bole height) and top (80% from DBH). The study showed the differentiation of SG of Ludai at different height level. Beside that the effect of SG at different distance from pith are also found. The average specific gravity value is 0.304. It has the highest specific gravity value at the middle part of the tree and nearest specimen to the bark. It is directly related to density, therefore it has opposite relation with moisture content. Thus many more research on Ludai should be performs as it can increase the usage of this non-commercial species in wood industries.
