

**UNIVERSITI TEKNOLOGI MARA**

**EVALUATION THE DEGREE OF  
GRAFTING ON OPMF, SiO<sub>2</sub>  
BIOCOMPOSITE**

**MUHAMMAD NUR SIDEK BIN  
ABDUL SAMAD**

**THESIS** submitted in partial fulfillment  
of the requirements for the degree of  
**CHEMICAL ENGINEERING**

**SEPTEMBER 2018**

## **ACKNOWLEDGEMENT**

Firstly, I wish to thank God for giving me the opportunity to embark on my research project 1 and for completing this long and challenging journey successfully. My gratitude and thanks go to my supervisor Dr. Suhaiza Hanim.

My appreciation goes to the UiTM and faculty of Chemical Engineering who provided the facilities and assistance during sampling. Special thanks to my colleagues and friends for helping me with this project.

Finally, this thesis is dedicated to the loving memory of my very dear father and mother for the vision and determination to educate me. This piece of victory is dedicated to both of you. Alhamdulillah.

## Table of Contents

AUTHOR'S DECLARATION.....	2
ACKNOWLEDGEMENT .....	3
CHAPTER ONE .....	6
1.0 INTRODUCTION.....	6
1.1 Research Background.....	6
1.2 Problem statement .....	8
1.3 Objectives.....	8
1.4 Scope of research .....	9
CHAPTER TWO .....	9
2.0 LITERATURE REVIEW .....	9
2.1 Introduction.....	9
2.2 Plantation .....	10
2.3 Palm oil in Malaysia .....	10
2.4 Production of Palm Oil .....	12
2.5 Oil palm fibre .....	13
2.5 Types of oil palm fibres .....	14
2.6 OPMF .....	15
2.7 Bio-composite.....	16
2.8 Constituents fibre .....	17
2.8.1 Reinforced fibre .....	17
2.8.2 Natural fibres .....	17
2.8.3 Matrices .....	19
2.8.4 Application of natural fibres .....	20
2.9 Biodegradation .....	20
2.10 LLDPE.....	21
2.11 Modification methods of natural fibres .....	22
2.12 Chemical modification .....	23
2.13 Grafting copolymerization.....	23
Chapter three.....	24
3.0 Research methodology.....	24
3.1 Introduction.....	24
3.2 Material.....	24
3.3 Silicon dioxide( $\text{SiO}_2$ ) are mimic as extraction from OPMF .....	25
3.4 Linear Low Density Polyethylene (LLDPE) .....	25
3.5 Other materials.....	26

# Evaluation on Degree of Grafting of OPMF, SiO<sub>2</sub> Biocomposite

## CHAPTER ONE

### 1.0 INTRODUCTION

#### 1.1 Research Background

Natural fibre is a kind of hair like raw material that can be directly obtained from an animals, vegetables, or mineral sources. The fibre is converted into nonwoven fabrics such as felt or paper or, after spinning into yarns and into woven cloth. Although nature abounds in fibrous materials, especially cellulosic types such as cotton, wood, grains, and straw only small number can be used for textile products or other industrial purposes. In economic considerations, fibre is useful for commercial purposes is determined by such properties as length, strength, pliability, elasticity, abrasion resistance, absorbency, and various surface properties. Other than that, they are in elastic condition which can stretch when tension is apply. Then, they will partially or completely return to their original shape or length when the tension is released. [Britannica ,2018]. They also are getting attention from researchers to utilize in polymer composites due to their eco-friendly nature and sustainability. The interest or an idea for the natural fibres as reinforcing material in composites primary have get an attention the past decades ago due to environmental concerns and also awareness of limiting petroleum resources to produce petroleum-based synthetic polymers. Additionally, it is related to adding value to agricultural products and solve environmental problems rise from agricultural products residue.

The copolymerisation of ethylene with higher olefins is a commercial prominence for manufactures of linear low-density polyethylene (LLDPE) and elastomer. (Chaichana et al., 2007). LLDPE is well-known for the extensive application in many purpose for instance in the manufacturing of plastic film. Nevertheless, due to LLDPE's shortcomings their usage become limited. This is because LLDPE has low thermal resistance, low mechanical strength and also poor optical properties. It is known that LLDPE has taken much interest in the manufacturing of plastics. These plastics can be derived to be made as pipes, food wrapper and so forth. China has taken the initiative to replace their conventional plastic micro-irrigation pipes with LLDPE plastic for the purpose of saving the water in the rural area, specifically in the northwest China (Lei *et al.*, 2006). Hence, it is vital to design a high performance compound to be used as the

structure of the micro-irrigating pipes. However, LLDPE comes with the shortcomings such as poor flexibility and processability. The addition of some inorganic particles such as nano-SiO<sub>2</sub> has been found that it is able to enhance the physical and mechanical properties, processability, resistance to environmental stress cracking and aging behaviour of various polymers (Lei *et al.*, 2006). It is a fact that LLDPE is well-known for its broad application in the industry especially in the field of plastics films. This is due to the positive characteristics that LLDPE has which are having better mechanical properties than LDPE, higher tensile strength, elongation at break and also has greater resistance to puncture and tearing (Kurian, 1992). Moreover, the addition to the advantages of LLDPE are the chemical resistance and also thermal stability, having a lower friction and higher softening point as well as less costly than LDPE. Despite all these appealing advantages of LLDPE, it also comes with the drawbacks. An initiative is taken by blending LLDPE with additives purpose to enhance the properties of the polymers. The blending of polymer with filler, especially the inorganic material is proven to be one of the most effective method to produce the polymer composites (Jongsomjit *et al.*, 2005).

Oil palm mesocarp fibre (OPMF) is one of the potential natural fibres that can be used in bio-composites production. These fibres are lignocellulosic excess left over in the palm oil mill. There are 5.74 million hectares of palm oil were plant in Malaysia. It is make Malaysia become one of the country that has largest palm oil producing countries in the world. (MPOB,2016). There is 14 % of fibre content in palm fruit while 78% to 82% of the fruits is mainly biomass and moisture.
