CO-CULTURE OF FUNGI AND BACTERIA

By:

NUR AMMIRA BINTI MD SHAMSUDIN

(2012683908)

Supervisor:

PROF DR JEAN-FREDERIC FAIZAL WEBER

Dissertation submitted in partial fulfillment of

the requirements for the degree of

BACHELOR OF PHARMACY (Honours)

FACULTY OF PHARMACY

2015

ACKNOWLEDGEMENT

My most appreciation goes to my supervisor, Prof Dr Jean-Frédéric Faizal Weber for his tremendous encouragement, support and ideas throughout my final year project. The supervision and ideas truly helped in writing this thesis. The special thanks to my co-supervisor Madam Leila Hilout. Her guidance, suggestion, and invaluable advice in conducting the experiment has contributed to the success of this study. Last but not least, my sincere gratitude goes to my parents and friends who kept giving me support and motivation during completing this project.

ABSTRACT

The aim of this study is to investigate the modulation of secondary metabolism of given the bacteria and fungi. Eleven species of fungi were selected based on their chromatogram profile as showed in the preliminary study. The fungi were GM29, CI08.3, CM01, ME17, GS41, GS38, GM33, GS47, CR25, CM20 and CR15.2. Meanwhile the bacteria were collected from the freezer at RiND which has been identified by the researchers. The bacteria were *Pantoea agglomerans* (1. Eg. 16), *Klebsiella oxytoca* (10. P1. 3), *Cronobacter sakazakii* (1. Tp. 5), *Pseudomonas putida* (1. Eg. 6), *Bacillus subtilis* (1. B2. 2), *Acinetobacter calcoaceticus* (6. Lc. 4) and *Bacillus cereus* (1.Eg. 17). These fungi were studied for their bio-activities when being cultured together with several species of bacteria in the MTP plate. The MTP plate was incubated for two weeks which later on proceeded with HPLC profiling. Based on the HPLC analysis, it showed that some of the selected fungi have a potential in eliciting the secondary metabolite compounds through the co-culture with bacteria. However the identification of the compounds had not yet completed.

CHAPTER 1

INTRODUCTION

1.1 INTRODUCTION

This chapter provides an introduction for the research. The introduction includes the background of the study, research question, objectives, hypothesis, significance and the limitation of study.

1.2 BACKGROUND OF THE STUDY

The history of drug discovery and development has begun since dawn of human civilization. Initially, drugs were not only used for physical remedies, but also for religious and spiritual healing. Over the centuries, drug discovery mainly originated from the study of organic plant products and also by animal products and minerals. The discovery went through a combination of trial and error experiments and tested on animals and humans to observe the effect.

The development of drugs went through continuous improvement. In late 1800s, the process has started to follow the scientific techniques. Since then more drugs have been discovered and produced at larger scale for manufacturing (Rishton, 2008). In the modern age, the process is subdivided into pre-clinical and clinical components. Compounds with a combination of promising potency and efficacy are tested in pre-clinical disease models. This compound is essential for subsequent cycles of chemical
