ACKNOWLEDGEMENTS

In the name of Allah, the Most Gracious and the Most Merciful Alhamdulillah, all praises to Allah for the strengths and His blessing in completing this thesis. Special appreciation goes to my supervisor, Mr. Ajimi Jawan, for his patience, enthusiasm, insightful comments, valuable suggestions, helpful information, practical advice and unceasing ideas which have helped me tremendously at all times in my final year project and writing of this thesis. His immense knowledge, profound experience and professional expertise in Environmental Science and Statistical Analysis has enabled me to complete this research successfully. Without his guidance and relentless help, this thesis would not have been possible. I could not have imagined having a better supervisor in my final year project.

Besides that, my sincere gratitude goes to lectures of Faculty of Applied Science that have been teaching me this semester such as Dr. Patricia Natin and Mr. Abdul Manap for their continuous assistance and willingness to answer any queries in my final year project. I am also grateful to the laboratory assistants of KOMSAT for their kindness, hospitality and technical support especially Encik Muhd Hanafi, Puan Dayang Saibillah and Encik Muhammad Sufri Salimun.

I also wish to express my deepest thanks to me beloved parents, for offering their unwavering support and encouragement through phone calls every week. Not to forget, I am also grateful to my siblings, Adibah Hamiza binti Ahmad Suhaimey and Muhammad Bustaman bin Ahmad Suhaimey for providing me with moral and emotional support. A special thanks to Haziq Abqari bin Hamizul for his care and encouragement during my down times.

Last but not least, I would like to express my sincere thanks to all my friends especially Salsyanney Nasir, Hazmeen binti Osman, Mohd Musawwir bin Mohd Masri, Iqmal bin Sapawi and Siti Zulaikha binti Muhamad Sukor for their kindness, company, friendship and advice in completing my final year project.

Adibah Hannisa Binti Ahmad Suhaimey

ABSTRACT

POTENTIAL OF ORANGE PEEL, SAW DUST AND *Moringa oleifera* SEED IN ADSORPTION OF PLUMBUM AND COBALT FROM WASTEWATER

Plumbum (Pb) and Cobalt (Co) are the common discharge in huge amount by the chemical industries. Due to the negative implications of Pb and Co to human health and environment, researchers opt for adsorption technique which are cheaper and efficient in removing heavy metal. In this study, orange peel, saw dust and *Moringa oleifera* seed are used to remove Pb and Co in wastewater. The adsorption experiment is done by leaving the adsorbent in plumbum nitrate and cobalt (II) chloride solution before analysing using Atomic Absorption Spectrophotometer (AAS). The percentage removal of Pb and Co are calculated. Several factors such as adsorbent dose (0.2, 1.0 and 1.8 g) and temperature (15, 30 and 45 °C) are investigated to see whether they influence the percentage removal of Pb and Co. Experimental result revealed that there is significant difference between temperature and percentage removal of Pb and Co ($p=0.000$) but there is no significant difference between adsorbent dose and percentage removal of Pb and Co adsorbent ($p=0.879$). Ranks of the most effective adsorbent to least effective adsorbent can be constructed in such that saw dust > orange peel > *Moringa oleifera* seed. Saw dust can remove high percentage of Pb and Co because saw dust consists of active ion exchange compound such as crude fiber, acid detergent fiber (containing cellulose and lignin) and hydroxyl groups such as tenins which are responsible for the binding of Pb and Co ions. In conclusion, saw dust is considered as the most effective adsorbent because it able to remove 90.73% Pb and 96.92% Co. Further recommendations that can be suggested to improve this study includes increase the adsorbent dose, use sample water from river instead of artificial wastewater, add more parameters such as contact time, pH, initial heavy metal solution concentration and size of particles adsorbent, use standard solution for the preparation of artificial heavy metal solution instead of metal salt dilution and use metal salt in the form of nitrate.
