AUTHOR'S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student	:	Norini binti Jaafar
Student I.D. No.	:	2006611828
Programme	:	Doctor of Philosophy (ED990)
Faculty	:	Education
Thesis Title	:	Secondary School Students' Understanding of Attributes for Solving Stoichiometry Problems
Signature of Student	:	
Date	:	March 2015

ABSTRACT

The aim of this study was to offer a comprehensive description of 423 secondary school students' level of understanding of the three attributes deemed necessary for solving stoichiometry problems. The three attributes were proportional reasoning, mole concept and chemical equation. This study also investigated the students' ability to solve stoichiometry problems and whether the three attributes have any significant relationship with the ability to solve the stoichiometry problems from the perspectives of academic ability. The students were given an Achievement Test to answer the 19 test items which were divided into three sections of A, B and C and three items for problem solving in Section D. Section A tested the understanding of the proportional reasoning, Section B and C the understanding of the mole concept and the chemical equation respectively. Section D was to determine the ability to solve stoichiometry problems. Cross-sectional descriptive statistics method was employed and the data collected were analysed by frequency counts in terms of percentages. Correlational analysis and stepwise multiple linear regression were employed to determine the relationship between the three attributes with the ability to solve the stoichiometry problems. The findings suggested that students were unable to apply the proportional reasoning learned in mathematics to solving proportional reasoning in chemical equation. The level of understanding to the meaning of the mole concept related to number of particles and mass is on the average. Pertaining to chemical equation, the level of understanding is below average. Students found difficulties in balancing the chemical equation when the ratio of the coefficients of the reactants and products are not 1 : 1 and also poor in explaining the meaning of the coefficients in the chemical equation. The level of ability to solve the stoichiometry problems is also low among the students. However, with better understanding of the three attributes, the ability to solve the problems increases. Generally, the higher achiever students show better performance for all the sections. ANOVA comparisons of means and Tukey HSD test show there is no significant difference between the mean scores for the average and low academic ability students. A need for innovative and creative teaching materials seems essential to enhance the level of understanding of the three attributes and to overcome misconceptions students have of the attributes in order to increase students' ability to solve stoichiometry problems.

ACKNOWLEDGEMENT

Alhamdulillah, I wish to thank Allah the Almighty for His blessings and the opportunity given to me to achieve the dream that I dreamt for a long time, i.e. to get the elusive PhD. It has been such a long and challenging journey in order to complete this thesis. In my effort to complete this thesis, many individuals have played their parts in giving me the guidance, ideas, support, strength, inspiration and motivation. Without them, this thesis might not be completed. Therefore, I would like to take this opportunity to express my appreciation and gratitude to the individuals who have significantly helped me with this project.

Firstly, I would like to express my sincere gratitude and thanks to my supervisor Assoc. Prof. Dr Beh Kian Lim, who had given me the guidance, ideas and patience while assisting me with the writing of this thesis. My gratitude and thanks also goes to co-supervisor Prof. Dr. Hj Nor Aziah binti Hj Alias, Director of Academic Development, Academic Affairs Division. Although very busy with her job as Director, she helped me tremendously and with great patience in order for me to complete this thesis. I would also like to express my thanks to the lecturers at the Education Faculty in giving me constructive inputs and assistance.

Secondly, my appreciation goes to my loving husband, Nik Mat bin Nik Man. He has been very supportive since the conception to further my studies at the PhD level. He has shown me the support, tolerance, love and given me the opportunity to achieve my dreams. A lot of sacrifices have been made by him. Therefore, I dedicate this victory to him. Lastly but not the least, I would like to thank my three children, Dr Nik Izyan Syaizana, Nik Ahmad Izwan and Dr Nik Ahmad Izany for being understanding and patient while their mother was busy with the research. Alhamdulillah.
