Thesis submitted in fulfillment
of the requirements for the degree of
Doctor of Philosophy

Faculty of Electrical Engineering

December 2014

AUTHOR'S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the result of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any other degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

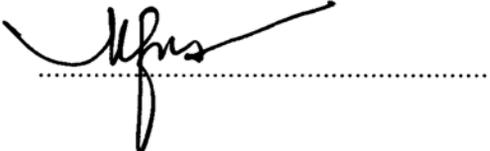

Name of Student : Mohamed Faiz bin Mohamed Said

Student I.D. No. : 2004314705

Programme : Doctor of Philosophy (EE990)

Faculty : Electrical Engineering

Thesis Title : The Programming Primitives Effects of the
Overlapping Message-Passing and Computation
in Beowulf Cluster Computing

Signature of Student : 

Date : December 2014

ABSTRACT

Beowulf cluster computing is one of the parallel architectures that has been extensively utilized by exploiting the commodity aspect of its hardware and also the open codes of its software. It offers many advantages, but in order to support parallel and distributed applications, many factors of the cluster system have contributed to the performance bottleneck. One of these factors is due to the explicit primitives of its message-passing implementation. Basically, these primitives are divided into two types; blocking and non-blocking communications. For optimization purposes, the primitives can be applied to allow the overlap of the message-passing and computation to create an application with optimal completion time. However, the effects on the low-level issues concerning data overhead by using different primitives have not been explored in details. This research project empirically looks into the effect of the overlapping message-passing and computation in the proposed Beowulf cluster. It also develops new analytical tool to analyze the overlapping effect, particularly on the programming primitives characterizations. The scope of this research is based on the use of the Message Passing Interface (MPI) point-to-point communication on a collection of four computers that are connected to a switch via a network. Each computer is installed with Linux operating system and connected by UTP cables using Ethernet. The results demonstrate that increasing the message size for an overlap message transfer with computation will intensify the peak processing consumption. By adding more processors, the computing cluster provides higher packet transfer among the nodes. Nevertheless, the results demonstrate that as the message transfer is increasingly overlapped with computation, the TCP/IP overhead of the packet decreases. This outcome provides significant findings on the characterization of the primitives overhead in the Beowulf cluster system. The understanding of these primitive characterizations and their efficiency will provide programmers to use them selectively as they will eventually contribute to the improved performance of parallel applications.

TABLE OF CONTENTS

	Page
AUTHOR'S DECLARATION	ii
ABSTRACT	iii
ACKNOWLEDGEMENT	iv
TABLE OF CONTENTS	v
LIST OF TABLES	ix
LIST OF FIGURES	xi
LIST OF ABBREVIATIONS	xviii
CHAPTER ONE: INTRODUCTION	1
1.1 Introduction	1
1.2 Problem Statement	2
1.3 Objectives	3
1.4 Significance	4
1.5 Contribution	4
1.6 Scope of Project	4
1.7 Thesis Organization	5
CHAPTER TWO: LITERATURE REVIEW	6
2.1 Introduction	6
2.2 The Overview of Parallel Computing	7

2.2.1	Beowulf Cluster	11
2.2.2	Variants of Beowulf Cluster	13
2.3	The Parallel Computers Algorithms and Approaches	17
2.3.1	Models of Parallel Computation	31
2.3.2	Applications on Parallel Computers	37
2.3.3	Performance Prediction and Simulation	39
2.4	Message Passing Interface (MPI)	41
2.4.1	Communication Protocol and Network File System	43
2.4.2	MPI Microbenchmarks	46
2.5	Review on Similar Works	54
2.5.1	Research Gap	59
 CHAPTER THREE: METHODOLOGY		 65
3.1	Introduction	65
3.2	STAGE 1: DEVELOPMENTS	66
3.3	Algorithm Design	78
3.3.1	Message-Passing Programming Primitives	79
3.3.2	Experimental Setup	82
3.3.3	Algorithm Flowchart	84
3.3.4	Packet Measurement	89
3.4	System Development	90
3.4.1	Results on Stage 2 – the Validation Test	91
3.5	Conclusion	101
