DECLARATION

This Final Year Project is a partial fulfilment of the requirements for a degree of Bachelor of Science (Hons.) Plantation technology and Management, Faculty of Plantation and Agrotechnology, Universiti Teknologi MARA.

It is entirely my own work and has not been submitted to any other University or higher education institution, or for any other academic award in this University. Where use has been made of the work of other people it has been fully acknowledged and fully referenced.

I hereby assign all and every rights in the copyrights to this work to the Universiti Teknologi MARA (UITM), which henceforth shall be the owner of copyright in this work and that, any reproduction or use in any form or by any means whatsoever is prohibited without a written consent of UITM.

ABSTRACT

IN VITRO PROPAGATION OF *Oryza sativa* (MRIA 1) USING DIFFERENT RATE OF BENZYLAMINOPURINE (BAP) AND NAPHTHALENE ACETIC ACID (NAA) HORMONE

This research was conducted to produce in vitro regeneration of MRIA 1 and the best concentration of BAP and NAA hormone which produce the best shoot and root growth can be determined. The treatment used were 0.0 mg/l of BAP and NAA, 0.25 mg/l BAP + 1.0 mg/l NAA, 0.50 mg/l BAP + 1.50 mg/l NAA, 0.75 mg/l BAP + 1.75 mg/l NAA, 1.00 mg/l BAP + 2.00 mg/l NAA, and 1.50 mg/l BAP + 2.25 mg/l NAA. Based on the research it can be conclude that the best concentration of hormone which produce the best growth of shoot and root is 0.25 mg/l BAP AND 1.00 mg/l NAA.
