ABSTRACT

DIPTERA SUCCESSION ON BURNED AND UNBURNED RABBIT CARCASSES AT PUNCAK ALAM AREA

Forensic entomology is the study of insects or arthropod which can be insert into part of the evidence in legal cases especially when involving with death enquiries. The dipteran succession was appear to be differ for each location because it depend on environment condition. The aim of this study was to investigate the dipteran succession and compare the species diversity between burned and unburned rabbit carcasses. The study was conducted inside UiTM Puncak Alam Campus, Selangor by using four male rabbit from the species of New Zealand white rabbits (*Oryctolagus cuniculus*). All rabbit used were 2.7 ± 0.2 kg and sacrificed using sodium pentobarbital through intraperitoneal. Observational study was conducted for 15 days; twice visit per day for the first four days, once per day for the next days, and climatological data (ambient temperature, relative humidity, and light intensity) were collected. The spearman correlation was used analyse the relationship between abundance of diptera and diversity of diptera species with climatological data; ambient temperature, relative humidity, and light intensity. Only adult flies was collected as data. *C. megacephala* was the first dipteran species that visiting the carcass for both condition on the first day (day 0). More dipteran species (unidentified species from Sarcophagidae family and *C. rufifacies*) was observed on unburned carcass while on burned carcass *C. rufifacies* was observed to present on the second day. The most dominant species on unburned carcasses was *C. rufifacies* whereas on burned carcasses *C. megacephala* was the most dominant species. The rate of decomposition for burned carcass was appeared to be faster than unburned carcass. From this study, we conclude that the burned carcass attract more population and had great species diversity of dipteran compared to unburned carcass.

TABLE OF CONTENTS

	PAGE
TITLE PAGE	i
DECLARATION	ii
ACKNOWLEDGEMENT	iii
TABLE OF CONTENTS	iv-vi
LIST OF TABLES	vii-viii
LIST OF FIGURES	ix
ABSTRACT	x
CHAPTER 1 INTRODUCTION	
1.1 Forensic entomology	1-2
1.2 Research background	2-3
1.3 Problem statement	3
1.4 Objective of the study	4
1.5 Hypothesis	4
CHAPTER 2 LITERATURE REVIEW	
2.1 History	5-6
2.2 Post-mortem interval	7
2.3 Factor that affect rate of decomposition	8-9
2.4 Stage of decomposition	
2.4.1 Fresh stage	9
2.4.2 Bloated stage	10
2.4.3 Wet stage	10
2.4.4 Dry stage	10
2.4.5 Skeletal stage	11

2.5	Animal model	11-12
2.6	Flies succession	12-14
2.6.1	<i>Chrysomya megacephala</i>	14-15
2.6.2	<i>Chrysomya rufifacies</i>	15-16
2.6.3	Sacrophagidae	16-17

CHAPTER 3 MATERIALS AND METHODS

3.1	Research site	18-20
3.2	Preliminary study	21
3.3	Field methodology	
3.3.1	Cages design	22
3.3.2	Animal model	23
3.3.3	Burned carcass	24
3.3.4	Observation on carcasses	25
3.3.5	Collection of arthropod sample	25
3.3.6	Climatological data	26-27
3.4	Laboratory methodology	
3.4.1	Arthropod sample	27-28
3.4.2	Data analysis	29

CHAPTER 4 RESULT

4.1	Preliminary study	30-31
4.2	Climatological data	31-34
4.3	Observation on carcasses	35
4.4	Comparison between burned and unburned carcasses	35-37
4.5	Unburned carcasses	
4.5.1	Cage 1	38-41
4.5.2	Cage 3	42-45
4.6	Burned carcasses	46
4.6.1	Cage 8	47-50
