AUTHOR'S DECLARATION

I declare that the work in this disertation was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Under Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Siti Safariah binti Mahat

Student I.D. No. : 2014286332

Programme : Bachelor of Science (Surveying Science and Geomatics) - AP220

Faculty : Architecture, Planning & Surveying

Thesis : The Reconstruction of Tail Boom Dauphin Helicopter 9M-IGB using Close Range Photogrammetry

Signature of Student : 

Date : January 2018

ABSTRACT

Visualisation in 3-dimensional of an accident wreckage is limitedly used. This paper explores how a reconstruction of a body part Dauphin Helicopter AS 365 N3/9M-IGB which is the boom tail of the helicopter by using a Photogrammetry technique, the Close Range Photogrammetry (CRP) as a counter check of the investigation done by the Air Accident Investigation Bureau (AAIB). Images of the tail boom were taken from each side of the object in order to have a high quality three dimensional view. Prior investigations, the remaining of the helicopter was laid down and arranged in two dimensional in order to investigate the cause of the accident and to identify which parts of the helicopter was missing. Therefore, the aim of this study is to define the damages of the tail that cause the crash in 3d visual. This study is conducted to develop the tail in 3-dimensional using CRP, differentiate the 3d visual with the actual image and to distinguish the impact of the detached part of the tail. The three dimensional model is generated using Agisoft Photoscan software where the visualization is then compare and analyze using CAD software. In conclusion, a high accuracy of 3d image can be generated from a good orientation of a photo and with adequate light exposure.
