## ABSTRACT

The surfaces that support an aircraft by means of dynamic reaction on the air are called **wings**. Regardless of the type of lifting surface, its **aerodynamic characteristics** of the wing section will strongly affected by the shape of the **wing section** (called **airfoil**).

The wing characteristics may be predicted from the known aerodynamic characteristics of the wing section. A considerable body of aerodynamic theory has been developed whereby it is possible to calculate some of the important characteristics of wing sections, one being the use of **PANEL METHOD** and with the aide of computers.

By the beginning of the 20<sup>th</sup> century, methods of **hydrodynamics** had been successfully applied to airfoils so as to allow the prediction of **lifting characteristics** for airfoil shapes, mathematically. These special shapes did not represent the optimum in airfoil performance, and experimental methods (that is the wind tunnel testing) guided by theory were used to determine the characteristics of **arbitrary shaped airfoils**. Eventually, the numerical technique of panel method has come into widespread use since 1970s.

**Panel Method computer codes**, is used for the purpose of estimating aerodynamic characteristics of **two-dimensional airfoil sections in ideal flows of negligible compressibility and viscosity effects**, with a primary intention as a preliminary evaluation tool used to obtain quick estimations of configuration aerodynamics. It is not the intent to replace wind tunnel or more rigorous analytical results, but rather to provide an efficient means of estimating vehicle aerodynamic characteristics and preliminary design stages.

Thus, base on these preliminary design estimation, this project will assimilate the **Utilization of Panel Method Using Fortran** (a reliable and convenience way to represent linear equations and other listings through computer programs) to predict the aerodynamic sectional airfoil coefficients namely **C<sub>l</sub> (lift)**, **C<sub>d</sub> (drag)** and **C<sub>m</sub> (moment)** so as further analysis of aerodynamic characteristics can be done with the results obtained. **NACA 0009 Symmetrical Airfoil** and **NACA 23018 Cambered Airfoil** configuration is used as a comparable results with the one obtained from Abbot and Von Doenhoff Airfoil Data.

Hopefully with this effort, those whose interest is Computational Aerodynamics, particularly with the use of Panel Method, will gain tremendously. To appreciate the **PROGRAM PANEL** is to really understand the gist of Panel Method. Enjoy reading.

Abstract	iv
Contents	v
<b>Chapter 1 Introduction</b>	
1.0 Introduction	1
1.1 Characterization of aerodynamic forces	2
1.2 Parameters that govern aerodynamic forces	8
1.3 Aerodynamic force and moment coefficients	
1.3.1 Dimensional theory	9
1.3.2 Force and moment coefficients	11
1.3.3 Pressure distribution on an airfoil	13
1.3.4 Velocity distribution	15
1.4 Two-dimensional airfoil representation of an airplane's wing	
1.4.1 Wing geometry	19
1.4.2 Airfoil families	22
1.5 Designing an airfoil	
1.5.1 Aerodynamic characteristics manipulation	27
1.5.2 Airfoil design	29
1.5.3 Analysing and comparing airfoils	30
<b>Chapter 2 Panel Method</b>	
2.0 Introduction	31
2.1 Governing equations and elementary flows	34
2.1.1 Bernoulli's equation	34
2.1.2 Pressure coefficient	35
2.1.3 Governing equation	35
2.1.4 Boundary conditions	36
2.1.5 Elementary flows	36
2.1.6 Kutta-Joukowski theorem	37
2.1.7 Kutta condition	38
2.1.8 Helmholtz theorem	41
2.2 The Source and Vortex Panel Method	43
2.3 Development of panel methods	
2.3.1 Types of panel methods	53
2.3.2 Comparisons of source-, doublet-, and vortex-based panel methods	54
2.3.3 Applications	56
<b>Chapter 3 Fortran Program Panel</b>	
3.0 Flowchart of panel method	58
3.1 Defining airfoil section	
3.1.1 NACA 0009 symmetrical airfoil section	59
3.1.2 NACA 23018 cambered airfoil section	61
3.2 PROGRAM PANEL	63
3.3 Sample output from PROGRAM PANEL	
3.2.1 Sample output for NACA 23018 at an angle of attack of 4 degrees.	82
3.2.2 Sample output for NACA 23018 at an angle of attack of 2 degrees.	85

3.3.3	All other angle of attacks sample output aerodynamic coefficients for NACA 23018	88
3.2.4	Input listing for NACA 0009 symmetrical airfoil	90
3.2.5	Sample output for NACA 0009 at an angle of attack of 2 degrees	93
3.2.6	Sample output for NACA 0009 at an angle of attack of 6 degrees	96
3.2.7	All other angle of attacks sample output aerodynamic coefficients for NACA 23018	99
<b>Chapter 4 Tabulated Results</b>		
4.1	NACA 0009 symmetrical aerodynamic characteristics	101
4.2	NACA 23018 cambered aerodynamic characteristics	102
<b>Chapter 5 Analysis</b>		
5.1	Velocity distribution	
5.1.1	Velocity distribution of NACA 0009 at three different angles of attack	103
5.1.2	Velocity distribution of NACA 23018 at three different angles of attack	105
5.1.3	Comparison between velocity distribution of NACA 0009 and NACA 23018 airfoil at zero angle of attack	107
5.1.4	Illustrations on velocity distribution	109
5.2	Velocity distribution	
5.2.1	Pressure distribution of NACA 0009 at three different angles of attack	110
5.2.2	Velocity distribution of NACA 23018 at three different angles of attack	112
5.2.3	Comparison between velocity distribution of NACA 0009 and NACA 23018 airfoil at zero angle of attack	114
5.2.4	Illustrations on pressure distribution	116
5.3	Lift and drag aerodynamic characteristics	
5.3.1	Sectional coefficient of lift versus angle of attack	
	1) NACA 0009	117
	2) NACA 23018	118
	3) Illustration on Cl versus Alpha	119
5.3.2	Sectional coefficient of drag versus lift	
	1) NACA 0009	120
	2) NACA 23018	121
	3) Illustration on Cd versus Cl	122
5.3.3	Sectional coefficient of (Cl/Cd) versus angle of attack	
	1) NACA 0009	123
	2) NACA 23018	124
	3) Illustration on Cl versus Alpha	125
5.3.4	Sectional coefficient of [ $\{Cl^{3/2}/Cd\}$ ] versus Alpha	
	1) NACA 0009	126
	2) NACA 23018	127
	3) Illustration on [ $\{Cl^{3/2}/Cd\}$ ] versus Alpha	128
5.5	Sectional coefficients of moment about the leading edge	
5.5.1	NACA 0009 Cm vs Alpha	129
5.5.2	NACA 23018 Cm vs Alpha curve	130
5.5.3	Illustration on sectional coefficient of moment	131

<b>Chapter 6 Panel method importance to CFD</b>	
6.1 Importance of computational fluid dynamics	132
6.2 Uses and applications	
6.2.1 Develop CFD	135
6.2.2 Applicability	136
6.3 Suggestion and improvements	137
<b>Chapter 7 Conclusions</b>	138
<b>References</b>	140
