ABSTRACT

The Onion Router (Tor) service is one of the ways to surf out over the internet without being worried too much about the internet data theft and privacy of the information inside data packet. This service uses an Onion Routing technique to serve the encryption and anonymity for data packet that need to be send to the destination by bounce the data packet to several servers in another country which located inside the Tor relay. Inside Tor network, it needs at least three nodes in order to randomly bounce the data packet. These nodes were entry node, middle node, and exit node. Besides, to protect user's data packet inside local area network, one layer of encryption was needed. Virtual Private Network (VPN) was a suitable service which will ensure the encryption for data packets in local area network. Hence, the combination of Tor and VPN service was the best creation and method that needed for a normal user to enhance its security and privacy inside local area network while surfing over the Internet. The main objective of this project is to use Tor and VPN network over a public network by implementing the Tor and VPN service inside Raspberry Pi access point. Therefore, the clients connected to Raspberry Pi access point be able to use Tor and VPN service directly without any installation and configuration. There were two experiments involved in this project. The first is the confidentiality test which to verify its privacy in keeping the information securely. The second is the performance test of the internet connectivity in terms of ping, download and upload speed while Raspberry Pi access point used Tor and VPN service and shares its connection to the client to see how the internet connectivity performance would react when Tor service changed the access point's IP address. The results after the experiments were implemented was expected as the confidentiality tested on the Torvpn access point network showed the positive outcome by securing client's internet data packet travel through it. Going well also is the internet connectivity test while connected to VPN and Tor service, where the internet connectivity is not enough stable when the client's IP address changed to another IP address. Lastly, the used of combination VPN and Tor service inside local area network can be concluded that it is secure and suitable to use to secure the information as well as the data packet travel over the internet but does not suggest for user who wants a good internet connectivity.

TABLE OF CONTENTS

CONTENT	PAGE
SUPERVISOR'S APPROVAL	ii
STUDENT DECLARATION	iii
ACKNOWLEDGEMENT	iv
ABSTRACT	v
TABLE OF CONTENTS	vi
LIST OF FIGURES	ix
LIST OF TABLES	xii
LIST OF ABBREVIATIONS	xiii
CHAPTER ONE	1
1.1 Background of Study	1
1.2 Problem Statement	3
1.3 Research Objectives	5
1.4 Research Scopes	5
1.5 Research Significance	5
1.6 Project Outline	6
CHAPTER TWO	7
2.1 Overview of The Onion Router (Tor)	7
2.1.1 Tor and Internet Filtering	8
2.1.2 Technical Background of Tor	8
2.2 Overview of Virtual Private Network (VPN)	15
2.3 Internet of Things	16
2.3.1 Overview of Internet of Things	16
2.3.2 Raspberry Pi Board	17
2.3.3 Technologies of Internet of Things	19
2.4 Related Work	20
2.4.1 Implementation of Tor	20
2.4.2 Implementation of Microprocessor Board	21
2.5 Discussion of Related Work	22
2.6 Chapter Summary	23

CHAPTER THREE	24
3.1 Information Gathering Phase	24
3.2 Planning Phase	25
3.3 Research Design Phase	26
3.3.1 Case Diagram	27
3.3.2 System Architecture	28
3.4 Project Requirement Phase	30
3.5 Development Phase	32
3.6 Testing Phase	34
3.7 System Maintenance and Documentation Phase	35
3.8 Chapter Summary	36
 CHAPTER FOUR	 37
4.1 Implementation	37
4.1.1 Raspberry Pi Setup	37
4.1.2 Virtual Private Server (VPS) Setup	38
4.2 Software Requirement	40
4.2.1 Raspbian OS	40
4.2.2 Raspberry Pi as Access Point	41
4.2.3 OpenVPN	42
4.2.4 Tor Installation Package	46
4.2.5 Apache2	49
4.2.6 Php5	49
4.2.7 Showip.net	50
4.2.8 Bandwidthplace.com	51
4.3 Raspberry Pi Torvpn Access Point Web Interface	52
4.3.1 Torvpn Access Point Local Web Page	52
4.4 Design	54
4.4.1 Logical Design	54
4.4.2 IP Addressing	55
4.5 Experiment Environment	55
4.5.1 Experiment 1	56
4.5.2 Experiment 2	57
4.6 Summary	58
 CHAPTER FIVE	 59
5.1 Result	59
5.1.1 Experiment 1	59
5.1.2 Experiment 2	62
5.2 Analysis	67
5.2.1 Experiment 1	67
5.2.2 Experiment 2	69
5.3 Summary	73
