TECHNICAL REPORT

**ANISOTROPIC DIFFUSION FILTER FOR REGION
ENHANCEMENT IN SEGMENTATION OF
BREAST ULTRASOUND IMAGES**

P03S19

**NURUL AIN FATEHAH BINTI ABDULLAH (2017169819)
NURUL ASYIQIN BINTI MOHD FAUZI (2017152985)
NUR AIN BINTI AMIRUDDIN (2017193869)**

**Report submitted in partial fulfillment of the requirement
for the degree of
Bachelor of Science (Hons.) Mathematics
Faculty of Computer and Mathematical Sciences**

DECEMBER 2019

ACKNOWLEDGEMENTS

First and foremost, we would like to thank Allah the Almighty, most gracious and merciful. We are very grateful as we are able to complete this research successfully although there are many obstacles during completing this project.

Apart from that, we would like to express our deepest gratitude to our beloved supervisor, Madam Aminah Malek for her guidance, support, and encouragement during the preparation of this project. She also sacrifices her time to make sure that we are always keeping on track. All her support and advice really give a big impact on us in proceeding with this study.

We would like to thank our Final Year Project (MSP660) lecturer, Sir Azdi Maasar for his advice and tips in class regarding the study. He also gives a great suggestion on using Academic Phrasebank for a good report writing. This advice had helped us a lot in our style of writing.

Last but not least, we are very thankful for our family and friends that constantly give us support until we successfully finish this study. Thank you, everyone.

ABSTRACT

Filtering is a process of removing noise in the images without blurring and preserving the boundaries between homogenous regions. It is an essential pre-processing technique before proceeding to the segmentation process. However, filtering had the difficulty of locating the meaningful region and boundaries which causes some severe blurring problems. Therefore, Anisotropic Diffusion Filter (ADF) method was used as the pre-processing technique in order to enhance the region of interest in the breast ultrasound images. ADF is a smoothing technique that controls the diffusion rate by using an edge stopping function to avoid over blurring on the images. Twenty breast ultrasound images were acquired from the radiologist to test the application ADF as an image enhancement technique. In order to evaluate the quality of filtered image, Mean Squared Error (MSE) and Peak Signal-to-Noise Ratio (PSNR) were calculated by comparing ADF with another filtering method which is Integral Filter. The MSE results show ADF has the lowest value of 9.2550 compared to Integral Filter at 49.4672. Whereas, PSNR of filtered image with ADF is 31.3484 higher than Integral Filter, 16.9034. This implies filtered image with ADF has the best quality image compared to Integral Filter. Subsequently, the image segmentation testing on filtered ultrasound images has been done by implementing the Seed Based Region Growing (SBRG) technique. The performance of segmentation results is measured in terms of accuracy based on the percentage relative error obtained by comparing with the area of segmented results without using ADF and with ADF. As a result, the percentage relative error of segmented areas with ADF is 10% which implies the accuracy of 90% while percentage relative error without ADF is 17.05% with an accuracy of 82.95%. Therefore, it is proven that ADF is the best option in enhancing breast ultrasound images and gives improvement to the segmentation process.
