ABSTRACT

Education and health level is the most important factors that measure the standard of living in one country. Moreover, this variable can affect the per capita income. This can be explained by the relationship between these variables. The purpose of this paper is to investigate and identify the relationship between impact of education and health on per capita income in Malaysia. The result of this study will indicate the effect and consequences of these variables and estimated whether there is strong relationship between them. The data used in this study was taken from World Bank Data and World Institute of Development Economics Research Database. Unit root (ADF), Ordinary Least Square (OLS) and diagnostic check is the methods used to test the data.
