## **ABSTRACT**

The development of experimental modal analysis as a non-destructive method caused by its criteria which offer effective solutions to real life engineering problems. Along with the development of modern computer technology, experimental modal analysis has been proven as an option to analyze complicated structural vibration problems. The parameter gathered by modal analysis can be used as an indicator of structural safety. Natural frequency which is the main parameter in modal analysis can indicate the deflection of the structure which is also significant in determining the structure's crack. The project focused on the identification of dynamic properties of simple mild steel beam with and without progressive crack. Two different cases are selected to be carried out for testing which are free hanging and simply supported condition. Progressive crack was seeded on a simple mild steel beam using a band saw. For a different crack depth the dynamic properties were determined using EMA (Experimental Modal Analysis). This project covers an experimental technique by using a dB Real Time Analyzer (dBRTA) or 01db 4-channel equipment and ME' Scope software. The results obtained which include the mode shapes and natural frequency will be analyzed and compared to the numerical model using Finite Element Analysis (ANSYS 5.7) software.

## TABLE OF CONTENTS

<b>CONTENTS</b>		<b>PAGE</b>
	PAGE TITLE	I
	ACKNOWLEDGEMENT	II
	ABSTRACT	III
	TABLE OF CONTENTS	IV
	LIST OF TABLES	VII
	LIST OF FIGURES	IX
	LIST OF GRAPHS	XI
<b>CHAPTER 1</b>	<b>INTRODUCTION</b>	
1.0	Introduction	1
1.1	Project Background	2
1.2	Objectives of Project	3
1.3	Significance of Project	3
1.4	Scope of Project	4
1.5	Methodology	4

<b>CHAPTER 2</b>	<b>LITERATURE REVIEW</b>	
2.0	Literature Review	5
<b>CHAPTER 3</b>	<b>FINITE ELEMENT ANALYSIS</b>	
3.0	Introduction	7
3.1	Basic Concept Modal Testing Using FEM	8
3.2	Process Flow in Finite Element Analysis	9
3.3	Finite Element Analysis Principle Steps	10
3.3.1	Model Construction	10
3.3.2	Definition of the Material Properties	11
3.3.3	Extrude the Mesh Area into Mesh Volume	12
3.1.4	Boundary Conditions	13
3.3.5	Solution	14
3.3.6	Block Lanczos Method	15
3.3.7	General Post-processing	16
<b>CHAPTER 4</b>	<b>EXPERIMENTAL METHOD</b>	
4.0	Introduction	17
4.1	The Apparatus Equipment	18
4.1.1	Boundary Condition	19
4.1.2	Exciter	20
