ACKNOWLEDGEMENT

"In the name of Allah, the Merciful, the Beneficent. Praise be to Allah"

Alhamdullilah, thanks to Allah S.W.T for His blessing and giving the opportunity and empowered me to succeed in the completion of this project paper at the given date. It has been the most fruitful experience being able to do this research and without His Grace and Mercifulness, this project paper may not be completed on time.

I would like to take this opportunity to give my most sincere gratitude to the following people.

Without you, this journey would have been really lonely.

Firstly, to my advisor, Sir Shahsuzan bin Zakaria, who has provided me with guidance, insightful suggestion and additional information. The knowledge obtained through this additional information is invaluable. I would also like to thank Madam Syukuriah binti Idrus for participating in this research. Your extensive knowledge and your input are most valuable. And lastly, to my friends and family. Without your constant encouragement and distraction, not only would i have not finished the paper, i also would not have had fun doing it.

Thank you.

ABSTRACT

Corporate governance is a fairly new concept which has been put into practice because of the

needs of companies to constantly perform better; and this is need that has made corporate

governance so necessary today. As a set of limitations which must be adhered to in order for a

company or firm to reach its optimal performance, corporate governance is a process which

ensures growth for a firm and the economy. The globalisation of banking and financial markets

has raised important issues regarding corporate governance regulation for banking and finance

institutions. This paper examine the relationship between three important corporate governance

mechanisms (board composition, board size and CEO status) and firm performance measures

(return on assets, ROA), for a sample of 15 Malaysian listed firms between 2007 and 2011.

The results provide evidence of a positive significant relationship between ROA and two

corporate governance mechanisms (board size and CEO status). The study, however, could not

provide a significant relationship between the firms performance measure (ROA) and board

composition. Statistical Package for the Social Science (SPSS) was used to analyze the data.

That is to examine the relationship between dependent and independent variables. To analyze

this study, researcher used both of simple and multiple linear regression.

Keywords: Corporate governance, firm performance, Malaysia
