ACKNOWLEDGMENTS

Alhamdulillah thanks to Allah, the almighty God that give me the opportunity to finish this thesis.

Upon completion of this project, I would like to express my gratitude to many parties. My heartfelt thanks goes to my supervisor Dr Ab Malik Marwan Ali, my co-supervisor Pm Dr Muhd Zu Azhan Yahya for all the information and knowledge that have been shared with me and also to my senior Mohd Faris for all of their encouragements, guidance, advices and ideas from the beginning of the preparation of the project to the completion of the thesis.

I also would like to thank my group members Noor Ayunie, Nur Hamizah, Siti Noor Hafiza and Nor Adiza for their full supports and cooperation to complete this project. Special thanks to my family who never fail praying for my success.

Lastly, I would like to thanks to all who had contributed for this study directly or indirectly with or without my concerns their contributions are gratefully acknowledged.

Thank you.

Nur Shahida Azib

ABSTRACT

CONDUCTIVITY STUDIES OF MG-30 COMPOSITE POLYMER ELECTROLYTES

In this study, composite polymer electrolyte comprised of MG-30 polymer host, Zinc chloride salt (ZnCl_2), propylene carbonate (PC) plasticizer and Aluminium oxide (Al_2O_3) filler are prepared using the solution casting technique. Impedance spectroscopy technique was carried out in order to determine the electrical conductivity value. Analysis showed that the higher conductivity was 2.08×10^{-4} S/cm is achieved when 20 wt% Al_2O_3 is introduced into the system containing 1.0g MG-30 doped with 60 wt% ZnCl_2 .

CHAPTER 1

INTRODUCTION

1.1 Background

A polymer is a large molecule (macromolecule) composed of repeating structural units typically connected by covalent chemical bonds. The physical and chemical properties of the polymer depends on the overall size of the polymer chain and on the inter- and intra- molecular forces that hold the polymer together. Basically polymer is insulator or unable to conduct electricity. Ionic conducting is useful in electrochemical devices such as lithium rechargeable batteries, fuel cells and electrochromic devices. Polymers become ionic conductor when inorganic salts are being added in them. In polymer electrolytes system, function of polymer is as an immobile solvent for the ionic salt. The good characteristic of polymer electrolytes are ionic conductors and electrical insulators. Polymer electrolytes can be classified into three groups that are dry polymer electrolytes, gel polymer electrolytes and composite polymer electrolytes. In additional, polymer electrolytes have a many advantages which are easy of preparation, flexibility, no-leakage of electrolyte, higher energy density, flexible geometry, improved safety hazards an enhance high ionic conductivity when adding plasticizer or filler. However, the main drawbacks of these polymer electrolytes are the low ionic conductivity at ambient temperature, poor electrode- electrolyte contact, and high internal resistance for use in electrochemical devices.
