ACKNOWLEDGEMENT

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL

First of all, we are very grateful to Allah S.W.T for giving us the strength and ability to complete this project successfully.

We would like to express our sincere gratitude and honorable to our supervisor, Mrs. Aminah Abdul Malek for her continuous support, patience, precious guidance and encouragement that greatly improved this research. We also like to thank to our lecturers for courses Mathematical Modelling (MAT530) and Final Year Project (MSP660), Dr. Maznah Banu Habiboo Raman and Dr. Mat Salim Selamat for their motivation and consistent advice in classes regarding the study.

We would like to extend the appreciation to Dr. Seri Buana Zainudin that give us an opportunity, hospitality and time spent during the data collection in his own clinic that placed at Pusat Rawatan Komuniti, Kota Bharu, Kelantan.

We are also very thankful for our family members and friends that are always support us from early stage of this project until the end. We also like to thank our colleagues who provided insight and expertise that supported this research. Our appreciation also dedicated to all faculty members from Faculty of Computer and Mathematical Sciences.

ABSTRACT

Fuzzy C-Means (FCM) is a method that has been broadly used in image segmentation of medical imaging. However, up until now it is hard to find a suitable method that can be applied in segmenting the granulation in a diabetic foot ulcer (DFU) images. This is because the complexity of a true colour images which included noise, blur and intensity non-uniformity always cause difficulties in segmentation process. FCM is also related to the repetitive computation of the distance between pixels within clustering centers and local spatial neighbours that makes the images having a complexity in computation. In order to overcome this issue, an Improved Fuzzy C-Means (IFCM) method based on Morphological Reconstruction (MR) and Median Filtering (MF) are used in this study. MR utilize the local spatial information of images in order to enhance the segmentation results. Meanwhile, the employment of MF is to modify the membership partition of the distance computation between pixels within local spatial neighbours in order to improve an image detail preservation and the noise-immunity of the images. The IFCM was tested on 30 DFU images that were taken by using smartphone where the segmentation is focused on the red part of the wound which called as granulation tissue. The performance of the segmentation results is measured in terms of accuracy and sensitivity based on percentage relative error obtained by comparing the area of image segmentation results using IFCM and expert findings. The results show that the percentage average relative error is 6% which implies the accuracy and sensitivity of the method of 94% and 93% respectively. From the results achieved, it is proven that the method used is applicable in segmenting the granulation of DFU images efficiently and effectively. In future study, the use IFCM can be extended to other types of medical imaging, predominantly on open cut wound.
