

**COMPARISON OF DIFFERENT HEATING MATERIALS FOR
THE DEVELOPMENT OF AN ARTIFICIAL FEEDING METHOD
FOR *Aedes albopictus***

By
MARIO JOSEPH

**Thesis submitted in Partial Fulfilment of the Requirement for Bachelor
of Medical Laboratory Technology (Hons),
Faculty of Health Sciences, Universiti Teknologi MARA**

2017

DECLARATION

I hereby declare that this thesis is my original work and has not been submitted previously or currently for any other degree at UiTM or any other institutions.

Signature :

Name : Mario Joseph

Student's ID : 2013227192

Date : 16th JULY 2017

ACKNOWLEDGEMENT

First and foremost, I would like to express my highest gratitude to God, Himself for the guidance, blessing and good health that I had received throughout the completion of this thesis. I would like to thank the Dean of Faculty of Health Sciences, UiTM Selangor, Puncak Alam Campus for providing me with all the necessary facilities and fund for the completion of this project. Not to forget, this project also partially funded by the Fundamental Research Grant Scheme (FRGS/1/2014/SKK10/UITM/03/1).

I place on record, my sincere thank you to my advisor Dr. Siti Nazrina Camalxaman for the continuous support of my final year project, for her patience, enthusiasm, motivation, and immense knowledge. Her guidance was absolutely precious which helped me a lot to finish my final year project and thesis writing. Besides my advisor, I would like to thank the rest of my co-advisor: Dr. Nazri Che Dom, Mr. Mohd Fahmi Mastuki, and Dr. Khairil Anuar Md Isa for their encouragement, guidance, and insightful comments. I also would like to thank Dr. Wan Mazlina Md Saad, the Head of the Medical Laboratory Technology Centre and all the laboratory staff for their invaluable help and support throughout the completion of my project.

My sincere thanks also go to the postgraduate students, Nur Mayamin Hamidi, and Nurul Adilah Amrannudin for their stimulating discussion and guidance on technical skills throughout the completion of these project and thesis writing. I take this opportunity to thank my partner Nurlina Yasmin Zulkifli and my fellow colleagues Nor Fadhilah Mohd Adam and Fatin Hannani Mohd Yusoff for their help, suggestions, and comforts that I need in completing my project and thesis writing.

I also want to thank my parents for the unceasing encouragement, support and attention. Without all of it, none of this would have been possible. Last but not least, I would like to thank everyone who directly or indirectly helped me in finishing my final year project and thesis writing.

3.1 Materials	19
3.1.1 Laboratory plastic ware and glassware	19

ABSTRAK

PERBANDINGAN DI ANTARA BAHAN PEMANAS BERBEZA BAGI PEMBUATAN KAEADAH MEMBERI MAKAN ARTIFISIAL UNTUK *Aedes albopictus*

Rasional penggunaan selaput pemberi makan artifisial adalah bagi mengurangkan penggunaan haiwan seperti tikus dalam kaerah memberi makan secara lansung untuk nyamuk menghisap darah. Kajian ini fokus kepada uji kaji minyak sayuran, air, dan gliserol bagi menentukan bahan pemanas terbaik untuk selaput pemberi makan artifisial dan bagi menentukan kadar pemakanan serta bertelur di antara nyamuk yang menghisap darah melalui kaerah memberi makan secara lansung (DHF) dan kaerah memberi makan artifisial (AF). Bahan-bahan pemanas diuji kaji dengan memanaskan bahan-bahan pemanas ke $\sim 80^{\circ}\text{C}$ dan $\sim 50^{\circ}\text{C}$ untuk memanaskan darah ke $37\pm 1^{\circ}\text{C}$ serta untuk mengekalkan suhu pada $37\pm 1^{\circ}\text{C}$, masing-masing. Nyamuk diberi makan selama 15 minit bagi kedua-dua kaerah dan telur yang dihasilkan dikira sehingga tujuh hari selepas sesi memberi makan. Kadar memberi makan dan bertelur di analisa dengan menggunakan “independent t test”. Bahan pemanas yang terbaik adalah gliserol dan terdapat perbezaan ketara bagi kedua-dua kadar memberi makan ($6.67\pm 6.67\%$ bagi DHF(r) dan $26.67\pm 6.67\%$ bagi AF) serta kadar bertelur (3.13 ± 1.59 telur bagi DHF dan 29.38 ± 2.9 telur bagi AF) untuk kedua-dua kaerah di mana nilai $P<0.05$, masing-masing. Walaubagaimanapun, telur yang dihasilkan dari kaerah AF (235 telur daripada 8 ekor nyamuk) masih cukup bagi pemeliharaan koloni nyamuk dan dengan penambahan saiz sampel bagi kedua-dua parameter, hasilnya dijangka meningkat. Konklusinya, selaput pemberi makan artifisial mencukupi untuk dijadikan sebagai kaerah alternatif dalam memberi makan nyamuk untuk tujuan penyelidikan.

Kata Kunci: *Aedes albopictus*, pemberi makan artifisial, bahan pemanas, kadar pemakanan, kadar bertelur.
