## ABSTRACT

The main objective of this study is to optimize the carbon absorption in palm oil plantation. This issue is chosen as this plantation was claimed as one of the cause of deforestation and carbon increase that lead to global warming. One way to achieve this objective is by calculating the total amount of carbon that being absorb by palm oil plantation. The variables involved in the study were the amount of carbon dioxide (CO<sub>2</sub>) absorbed that was measured in MG C/Ha, the age of the trees (years), the number of palm oil trees in a district and total hectares of the estates. This study identifies the amount of carbon absorption of palm oil plantation in seven districts of Negeri Sembilan which were Jelebu, Jempol, Tampin, Kuala Pilah, Seremban, Rembau and Port Dickson. Data was collected from Malaysian Palm Oil Board (MPOB). The Simplex Algorithm in Linear Programming Method using QM for Windows is applied to find the solution. Hence, the analysis was carried out and the result showed that 7199.64 Mg C/Ha was the optimal value for the amount of carbon dioxide absorbed in Negeri Sembilan. In conclusion, it was observed that the larger the area planted with palm oil, the higher the amount of carbon dioxide absorbed. Result has shown that, this plantation not only produce good edible oil but help in improving the atmosphere by absorbing more carbon.

## **ACKNOWLEDGEMENTS**

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL

Firstly, Alhamdulillah and we are thankful to Allah S.W.T for His Faithful and gave us the opportunity and strength to complete our Final Year Project (MSP660). However, it would not have been possible without the support and help from many individuals.

We would like to express our gratitude and deepest appreciation to our dearest supervisor, Madam Noryanti Binti Nasir who gave us the opportunity to accomplish a report on Maximize the Carbon Absorption of Palm Oil Plantation in Negeri Sembilan and willing to help us in doing this research. Besides, thanks to our parents who gave unstoppable moral supports and motivation to finish the research. We also would like to thank Malaysian Palm Oil Board (MPOB) Seremban Branch because has given satisfactory cooperation and a kind service for us in obtaining the data.

Not to be forgotten, our STA650 and MSP 660 lecturers, Madam Nora Binti Basir and Madam Che Norhalila Binti Che Mohamed for their continuous support, guidance and encouragement in order to complete this report successfully from the first phase till its completion. Then, we also would like to thank the panels, Madam Noorezatty Binti Mohd Yusop and Madam Nurul Nisa' Binti Khairol Azmi for help us with the report presentation. Last but not least, thanks to our friends and family who always gave moral supports, information and guidance until we manage to complete this final year project. It is honest and polite to give a million of appreciation to those who had involved in the research.
