ABSTRACT

A good layout is considered on two main points such as element and principle. Element such as texture, size line, shape, space, value and color are very important while principle is concerned more on the balance, rhythm, emphasis and unity of the layout. Thus, a good layout must also consider on the safety aspect, to ensure the place (design/layout on that building) is safe. In making a layout, the analysis of design should include other factors such as convenience, ergonomics, safety and minimizing bottleneck

ACKNOWLEDGEMENT

Alhamdulillah, thank to Allah because we have finish our final report project KJP 365. We would like to give our special thank to those who helped us in finishing our final project.

Firstly, we would like to give our special thanks to our Supervisor, Prof. Madya Hj. Asli bin Kasim, for his concerned, helpful and faithful advices as support to make this project achieved its purpose and reality.

We are glad for all supports and motivations given by the concern parties while we were in the process to complete our project. Here we would like to express our sincere appreciation and thanks to En Abdul Shukor and En Khairul Nizam; Assistance of Mechanical Engineering, En Saupi bin Mohamed Noor; Coordinator Of Mechanical Department from Politeknik Seberang Perai, En Nazri Bin Hashim; Manager of KAC Engineering Sdn Bhd, En Shahdan lecturer from JMTI and those who had helped us in order for us to complete this project.

Great thanks also to our nearest friends and our beloved family that helped us in making this final project. They had given many experiences to us how to make a good layout project either in software or in hardware.

We also want to give our special thanks to Uitm Staff that helps us in providing useful information in making this project successful.

Last but not least, our special thanks also to everyone who involve directly or indirectly in making the hardware and software in order to prepare this project successfully.

Thank you very much.
