AUTHOR'S DECLARATION

I declare that the work in this dissertation was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Student I.D. No. : 2016282156

Programme : Master of Occupational Therapy (Developmental Disability)

Faculty : Health Sciences

Thesis : Visual Perception Skills And Handwriting Performance Among Children With Autism And Typically Developed Children

Signature of Student : 

Date : February 2019

ABSTRACT

Autism spectrum disorders (ASD) are neurodevelopmental disorders which associated with a high prevalence of fine motor difficulties and executive function impairments that contribute to acquisition and performance of skilled motor tasks (Jasmin et al., 2009). The current evidence implicates impairments in fine motor control and visual-motor integration as likely contributors to handwriting difficulties in children with ASD (Hellinckx, Roeyers, & Van Waelvelde, 2013). The objectives of this study are: (i) to identify the relationship between demographic characteristic and handwriting performance among children with autism and typically developed children; (ii) to identify the relationship between visual perception and handwriting performance among children with autism and; (iii) to identify the relationship between visual perception and handwriting performance among typically developed children. This study is a cross-sectional study where 86 of children with autism and 86 of typically developed children are assessed using two standardized assessments which are Minnesota Handwriting Assessment (MHA) and Developmental Test of Visual Perception Second Edition (DTVP-2). The results show that there is medium positive correlation between age and handwriting performance, $r=0.31$, $n=86$, $p<0.005$ for children with autism and $r=0.37$, $n=86$, $p<0.005$ for typically developed children where older children have better handwriting performance compared to younger children. Apart from that, there is medium positive correlation between visual perception and handwriting performance among children with autism, range from 0.32 to 0.528, $n=86$, $p<0.005$. In addition, there is medium positive correlation between visual perception and handwriting performance among typically developed children, range from 0.23 to 0.461, $n=86$, $p<0.005$. Findings of the present study show that children with good visual perception skills able to produce good handwriting. Perhaps, in the future occupational therapy should be directed toward enhancing the visual perception skills when giving intervention to children with handwriting difficulty, especially children with autism. In conclusion, poor visual perception skills such as eye-hand coordination, position in space, copying, figure-ground, spatial relations, visual closure, visual motor speed and form constancy will produce poor legibility and reduce handwriting speed.

ACKNOWLEDGEMENT

Firstly, I wish to thank God for giving me the opportunity to embark on my Master Degree and for completing this long and challenging journey successfully. My gratitude and thanks go to my supervisor Dr Padma A. Rahman.

My appreciation goes to the Headmaster of the primary schools involves in this study who provided the facilities and assistance during sampling. Special thanks to my colleagues and friends for helping me with this project.

Finally, this thesis is dedicated to the loving memory of my very dear late father and mother for the vision and determination to educate me. This piece of victory is dedicated to both of you. Alhamdulillah.
