## Acknowledgments

We would like to express our deep gratitude to our supervisor, Puan Nur Saadah Binti Muhamad Sauki. Her lectures was a great value in the preparation of this thesis and thanks for her valuable guidance , suggestion , and support through this year.

We would also like to thanks to all lecturers whom help us through this project. With his or her guidance and especially to their endless patience , highly valued advices and helpfulness in our project. Finally, we would like to thank our families and friends because they always help and support us over this year.

## Abstract

Nowadays, electrical energy that has been consumed during the night is very high in the whole wide world. Although there are many ways to save energy consumption to do so, lights are one of the most high energy consumption during the night. Usually we will use a manual switch to turn on and off lights, but what if it can automatically turn on and off at certain circumstances during the night?

In this project, the main purpose is to design an automatic light corridor that will switch on by detecting motion. The PIR sensor will be used in this circuit to sense moving objects. The circuit is designed to be fully functional during the night and in daylight, the circuit will automatically set to idle by using an LDR. The sensitivity of the LDR will be set for the circuit to differentiate between daylight and night. The PIR sensor frequency will be set to detect motion. The sensor will be attached to the corridor ceiling along with 3 LEDs and the LDR will be at the top of the roof. Two LEDs with low power consumption will be set at each corridor edge as passive light that only turns on during the night. We are using 3 sensors, 5 LEDs and 1 LDR.
