ACKNOWLEDGEMENTS

First and foremost, I offer my sincerest gratitude to my supervisor Puan Shakira binti Azli. She had been a wonderful supervisor and made a great contribution to our Final Year Project. The support and encouragements that she had given to us is greatly appreciated. The time that has been put to make this project a success is enjoyable with her acting as our supervisor. Lastly, I offer my regards and blessings to my colleagues and all of those who supported me in any respect during the completion of the project.

ABSTRACT

Automatic cloth hanger is designed to ease the problems for working people. This may be a great idea to be worked for the future. Here we have designed a quite simple project to help human reduce their time and energy. The aim is to make the working people easier on how to manage their time efficiently. We have obtained the result for this project based on the rotation of the dc motor that we used. We are using 2 sensors which is LDR and water sensor. This sensor will determine the rotation of the motor whether it rotate clockwise or anticlockwise direction. It is observed that the dc motor will works as it supposed to be.
