## AUTHOR'S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student	:	Nur 'Izzati Binti Ismail
Student I.D. No.	:	2014904775
Programme	:	MSc.(Wood Science Technology) AS754
Faculty	:	Applied Science
Thesis Title	:	Potential of Cassava as Particleboard Raw Material
Signature of Student	:	..... <i>Nur 'Izzati Ismail</i>
Date	:	August 2020

## ABSTRACT

Cassava (*Manihot esculenta Crantz sp*) stems residues were mostly abandoned due to improper waste management in agricultural field after its roots were harvested. Study on the fundamental properties of cassava and information gained could assist on its application as particleboard. In this research, physical and chemical properties of cassava stems were assessed. Physical properties involved were moisture content, specific gravity together with shrinkage and swelling while chemical properties tested were lignin content, hot water solubility, alcohol-toluene solubility, 1% sodium hydroxide test, holocellulose content and ash content. Particleboards were fabricated from it and basic properties were related with the board's physical and mechanical properties. 7%, 10% and 13% resin content were used according to the locations along the stem height (top, middle, and bottom). From the chemical analysis, the extractive contents (alcohol toluene and hot water), holocellulose, lignin and ash content show a higher value in bottom part. Moisture content reading from the green wood cassava stems samples indicate that the moisture in all parts are high. Maximum reading of green wood and oven dried wood shows that highest reading can both be seen in bottom location. Specific gravity has no significant effect between locations along the stem height although middle displays the highest reading. Same goes with shrinkage and swelling rate of cassava stems, it does not have a significant effect with each other even though tangential has the highest rate in shrinkage and radial for swelling. Cassava stem-based particleboard demonstrates that higher resin will increase the strength according to MOR, MOE, and internal bond besides decreasing the board's water absorption rate and thickness swelling.

## ACKNOWLEDGEMENT

First, I wish to thank Allah for giving me the opportunity, health, and strength to embark on my Master journey and in completing this long and challenging process successfully. My gratitude and thanks goes to my supervisor Assoc. Prof. Dr. Kamarulzaman Nordin for guiding me step by step from beginning until the end of the process with patience and determination, I will never forget the advices, reminders and all those motivational speech that you gave to us so that we will never quit this journey. To my co-supervisor, Prof Dr. Mansur Ahmad, thank you for picking us up and channelled your endless support from the moment where we thought that this journey is too exhausting plus burdening to complete. Thank you both of you again for the support, perseverance, and ideas to deal with this project. I also would like to express my gratitude to the staff of the Faculty of Applied Science, especially Encik Hishammudin, Encik Azli, Encik Akmal for providing the facilities, knowledge, and assistances. Not forgetting, the PPS staff that handles all my enquiries and lecturers, Prof. Dr. Mohamad Faiz Foong Abdullah and Dr. Rasmina Halis, that ease my thesis submission process when I thought that hope was almost gone. Thank you for everything.

My appreciation also goes to the members of Lab B408, Norhayati Hamzah, Nor Atiqah Ayob, Syaiful Osman, Bibi Amirah Zyni, Muhammad Iqram Ibrahim who provided advices and assistance during sampling, experiments and even willing to accompany us for the sake of our project. Special thanks to them as my colleague and supportive friends for all this time. You guys were my medicines. Without you as role models, this journey would be impossible for me to get through.

Finally, this thesis is dedicated to my handsome, loving, supportive and considerate husband, Nor Hafeez Norizam, my parents, Ismail Mat Shah and Rohaya Mokhtar, my mother in law, Habibah Jalaludin, my siblings, my new siblings, and my best friends cum sisters, Nurus Sakinatul Fikriah and Alia Ezrie Ashiqin for the love, on-going support and again patience to bear with me along this journey. I love you all so much and this piece of victory and satisfaction is dedicated to all of you. Alhamdulillah.
