## ABSTRACT

Balik Pulau, Penang is one of the industrial areas in Malaysia. A lot of heavy industries and factories operate here, thus making air pollution an issue that can no longer be avoided by the residents around the area. Polluted air results in limited daily activities and health problems for the population either in the short or long term. To find out the changes in the air pollution index, the air pollution index forecast is done to analyse the pattern that will form in the future. This will help the community become more aware of air pollution and be prepared for any circumstances in the future. There are various methods to carry out the prediction process; one of it is to use the fuzzy time series method. In this case study, Chen's fuzzy time series method is used to construct a model to forecast the air pollution index in Balik Pulau, Pulau Pinang by using daily historical data from 2020. Chen's method is done by using Sturges method to determine how many intervals are needed to form a certain amount of linguistic values which is later used as a fuzzy set. From the Sturges method, only ten linguistic value were acquired, which is not enough for forecasting purposes. Chen's fuzzy time series method does not depend on the previous data to forecast; thus, the forecasted value is deduced from the intervals of the fuzzy sets obtained. In this study, Chen's method gives Root Mean Squared Error (RMSE) = 9.29 and Mean Absolute Percentage Error (MAPE) = 16.86. This indicates that the model is a suitable method for forecasting purposes.
