AUTHOR'S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Shamimi binti A. Halim

Student I.D. No. : 2010933319

Programme : Doctor of Philosophy in Information Technology
and Quantitative Sciences – CS990

Faculty : Computer and Mathematical Sciences

Thesis Title : Enhancement of CommonKADS Assessment Task
for Domain Expert Maintainable Knowledge-
Based System

Signature of Student : 

Date : May 2021

ABSTRACT

Modelling and specifying the knowledge components for future use allow the Knowledge-based System (KBS) to continuously generate an accurate result and sustain the competency, efficiency and effectiveness of its problem-solving capabilities. Knowledge modelling conceptual the knowledge-intensive activities which include task and domain knowledge while knowledge specification specifies the inference knowledge that is required to facilitate the KBS reasoning process. Inference knowledge describes the steps or rules used to perform a task inference, i.e. making reference to the domain knowledge that is used. This knowledge is typically acquired by knowledge engineer from the domain experts and communicated to the system developers during knowledge gathering and system maintenance phase. Although the involvements of the knowledge engineers and system developers' team during the maintenance phase is important, one of the main issues that remain is the increasing of KBS development cost when both teams are no longer available to mediate the maintenance task. Hiring new teams, on the other hand, might cause inconsistency and unreliability of the KBS. Therefore, this research opts the domain expert to support the extension and reduction of knowledge within the KBS by focusing on the explicit representation of inference knowledge. The knowledge within the hospital emergency triage assessment decision making is selected as a case study. To develop the KBS that able to be maintained by a domain expert, a European *de facto* standard for knowledge modelling, the CommonKADS knowledge engineering methodology is regarded. The generality of terms and problem-solving methods offered by this methodology nevertheless requires much effort thus becomes an adaption issue by knowledge engineers and developers. Hence, this research contributes an adaption guideline and subsequently enhance the methodology in developing a KBS that enables it to be maintained by the domain expert. The enhancement was validated by adapting the guideline into two knowledge-intensive tasks, i.e. classification and diagnosing with two case studies for each task. The validation attained more than 85% of positive response in adapting the guideline to model the task and domain knowledge. Next, to validate the ability of the domain expert to maintain the KBS, the time taken to annotate the inference knowledge showed that 75% of domain experts able to do annotation with less than five minutes. The results show that the enhancement provided domain expert with the ability to maintain a specific Knowledge-based System. As a future work, the user's experience should be involved as a part of the validation aspects and the explicit representation of inference knowledge should be extended into another type knowledge-intensive task.

ACKNOWLEDGEMENT

Firstly, I thank Allah, the Almighty for giving me the opportunity to embark on my PhD and for permission me completing this long and challenging journey successfully. My sincere gratitude and thanks go to my supervisors; Prof. Dr Hjh Azlinah Hj. Mohamed and Assoc. Prof. Dr Muthukkaruppan Annamalai, my co-supervisors; Prof. Dr Rashidi Ahmad and Prof. Dr Sharifuddin Ahmad for their continuous support, patience, motivation and immense knowledge.

I would like to express my sincere gratitude to my loving family who always be at my side, accept me at my strongest and support me at my weakest. Special thanks to my colleagues and friends for helping and encourage me with this journey.

Finally, this PhD is dedicated to the loving memory of my very dear late mother and father; Allahyarhamah Hjh Hanisah Tahir and Allahyarham Hj A. Halim Abas, who return to Him during my PhD journey, for the love and sacrifices to educate and prepare me for who I am today. May Allah forgive their sin and have mercy upon them as they had mercy upon me.

Subhanallahi Wabihamdihi, Subhanallahil A'zhim.
