## **AUTHOR'S DECLARATION**

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Maizatul binti Zolkapli

Student I.D. No. : 2013653228

Programme : Doctor of Philosophy (Electrical Engineering) –  
EE950

Faculty : Electrical Engineering

Thesis Title : Quasi-Distributed Oxygen Sensor Based On  
Evanescent Wave Scattering In Optical Fiber

Signature of Student :

Date : April 2019

## ABSTRACT

This thesis deliberates the development and characterization of a multipoint quasi-distributed optical fiber sensor for oxygen measurement based on luminescence quenching. Current sensing devices such as the Clark cell or the luminescent probes located at distinct points in the water column are incapable of providing the dissolved oxygen measurement for the entire area of the pond in toto. Hence there is a need for the development of a new technique which measures the level of oxygen in the water at various depths and locations within a single optical fiber line. Towards this objective the new technique developed is based on luminescence quenching which reflect the overall oxygen concentration in aquaculture ponds. The research focuses on the development of a sensing mechanism which could be applied to optical fiber cladding/core region to produce optical fiber oxygen sensor in quasi-distributed arrangement and subsequently characterized using a suitable test method under laboratory conditions. The system is based on 1 mm core diameter plastic optical fiber where three sections of cladding have been etched using acetone resulting in a parabolic shaped cavity characteristic of the refractive index profile of the fiber. These cavities were then filled with sol-gel derived silica doped with the oxygen-sensitive dye. In this study ruthenium complex Tris(4,7-diphenyl-1,10-phenanthroline) ruthenium(II) dichloride complex ( $\text{Ru}(\text{dpp})_3^{2+}$ ), platinum octaethylporphyrin (PtOEP) and palladium(II)-5,10,15,20-tetrakis-(2,3,4,5,6-pentafluorophenyl)-porphyrin (PdTFPP) were the dyes chosen, immobilized in a microporous glass produced by the low temperature sol-gel process to form the various sensing locations. Each of the luminophores had different emission wavelengths resulting in individual spectral peaks associated with each of the sensing points. Advantages of using this method of reagent capture are discussed and the sensor fabrication steps deliberated. Interrogation of the optical sensor system was through a fiber optic spectrometer incorporating narrow bandpass emission optical filter. Experimental characterization for the quasi-distributed optical fiber oxygen sensor in both gas and water were detailed. Results from the present study showed that the proposed sensors exhibited comparable sensitivity and repeatability as well as fast response and recovery towards oxygen.  $I_0/I_{100}$  among the three films for both gaseous and dissolved oxygen were  $\text{Ru}(\text{dpp})_3^{2+} < \text{PtOEP} < \text{PdTFPP}$ .

## ACKNOWLEDGEMENT

Alhamdulillah, all praises belong to Allah, we praise Him, seek His help and ask for His forgiveness. We seek refuge in God from evils of our souls and our bad deeds. A person guided by God will never be misguided by anyone and a person who is misguided by God can never be guided by anyone. I bear witness that there is no God but Allah alone, who has no partner. There is no power but with Allah.

All praises are due to Allah the Almighty, the Merciful.

It is with great pleasure to acknowledge my supervisor, Assoc. Prof. Dr. Wan Fazlida Hanim Abdullah and both my co-supervisors Dr. Suhairi Saharudin and Dr. Sukreen Hana Herman for their guidance, insights and supports in the completion of this thesis.

My appreciation also extends to MIMOS Berhad who has given me the opportunity to participate and utilise their facilities under MOSTI's Science fund project (06-03-04-SF0030-A Unified Quasi-Distributed Optical Sensing for Aquaculture Based on Nanomaterial Doped Optical Fiber) which was executed under MIMOS-UiTM Collaborative Research and Development Agreement project 2013.

Thank you to all the staffs of Photonics Department at MIMOS Berhad, members of Photonics Lab in UPM and Assoc. Prof. Dr Zainiharyati Mohd Zain from Faculty of Applied Science, UiTM for their assistance and permission to use their equipment.

I would also like to thank the Ministry of Higher Education and Universiti Teknologi MARA for funding my study through the SLAB scholarship programme as well as the Niche Research Grant Schemes (600-RMI/NRGS 5/3 (6/2013)).

Most importantly, my deepest gratitude goes to my supportive husband, Tunku Shariz Tunku Azmi, my wonderful children, Tunku Maisara and Tunku Muhammad Raziq, my understanding parents Zolkapli Yeop Salleh and Rokiah Mohd Yusoff, my caring father in-law Tengku Azmi Tengku Ibrahim as well as my family members and friends for their unrelenting prayers, endless encouragement and support in the time of need. Only with their love was this thesis made possible. Alhamdulillah.
