ACKNOWLEDGEMENT

First and foremost, we would like to thank to our supervisor of this project, Sir Mohd Aldrin Bin Ali for the valuable guidance and advice. He inspired us greatly to work in this project. His willingness to motivate us contributed tremendously to our project. We also would like to thank him for showing us some example that related to the topic of our project. Besides, we would like to thank the authority of Universiti Teknologi Mara Teknologi (UITM) for providing us with a good environment and facilities to complete this project. Also, we would like to take this opportunity to thank to the Faculty of Diploma Electrical Engineering (Electronic) (FKE) for offering this subject. Final Year Project (FYP). It gave us an opportunity to participate and learn about how to design young coconut opener. In addition, we also wanted to thank our families who inspired, encouraged and fully supported us in every trial that came our way. Also, we thank them for giving us just financial, but moral and spiritual support. Finally, an honorable mention goes to all friends for their understandings and support. Finally, an honorable mention goes to all friends for their understandings and supports on us in completing this project. Without helps of the particular that mentioned above, we would face many difficulties while doing this. We are grateful for their constant support and help.

ABSTRACT

First of all, we would like to introduce our project. It is has been named as Young Coconut Opener. Nowadays, people be inclined to use 'parang' to open young coconut. Actually, using 'parang' is very dangerous and can cause injury to the user. Other than that, it will take some energy and time to open young coconut. Futhermore, by using it to cut the young coconut, coconut water will spilled out. This will be wasteful. Today, there is no special tool that has been created to open the young coconut without using physical movement. There is only a tool that has been created to make a small hole at the coconut to put straw into it. But, we still can not eat the coconut kernel. So, we design our project to overcome this problem. Our main part of our design consist motor, body, coconut holder and the driller. Firstly, we on the switch of the machine and the drill will rotate on the young coconut until the slice of young coconut is open. This project will be useful to user that can save time and energy because it uses motor (on/off) to open young coconut.
