Universiti Teknologi MARA

KEYWORD SEARCH FOR DOA RETRIEVAL USING N-GRAM METHOD

ANIS SAFURAA BINTI AHMAD TAJUDIN

Thesis submitted in fulfillment of the requirements for Bachelor of Computer Science (Hons) Computer Science
Faculty of Computer and Mathematical Sciences

JULY 2015

ACKNOWLEDGEMENT

Alhamdulillah, praises and thanks to Allah because His Almighty and His utmost blessings, I was able to finish this research within time duration given. Firstly, my special thanks to my supervisor, PM Zaidah Binti Ibrahim. She gives many advices, criticism, guidance and creative ideas during completed this final year project. The special thanks also dedicated to my final year project lecturer, Dr Norhaslinda Binti Kamaruddin gives the support and criticism and also guidance to achieve of this final year project. Special appreciation also goes to my beloved mother for her encouragement, patience, support, financial support and sacrifice that she have given me during the course of this thesis. Last but not least, I would like to give my gratitude to my dearest friends that they help directly or indirectly to completed my final year project

ABSTRACT

The rapid growth of the Internet has increased the number of stored and available data tremendously for online documents. One of the documents is Doa which is an act of supplication. Doa is derived from Arabic word which means that one asks for the fulfillment of a need or that some harm be removed from him/her. One way to retrieve the appropriate Doa is to construct a prototype to search and retrieve the appropriate Doa. There are some applications that require using the exact match of the keyword search with the words stored in the database. This approach leads to the retrieval of insignificant results. Thus, this project utilizes N-gram method for the search and retrieval process. Various words may have similar meaning and to increase the accuracy of the retrieved result, this project applies the dice and overlap coefficient algorithm to find the synonyms of the searched word. A relational database for the Malay words has been constructed in two table which is title of doa and verse and the prototype to retrieve the Doa in Arabic, its' meaning in Malay and the use of it has been developed. The result is overlap coefficient percentage result better than dice coefficient.

Keywords: Relational Database, Keyword Search, Dice and Overlap Coefficient, N-Gram Algorithm, Malay keyword.
