SERVER BASED CONTENT ADAPTATION ARCHITECTURE USING
CONTENT SWITCHING

RIZA HADAFI PUNARI

MASTER OF SCIENCE IN COMPUTER NETWORKING

NOVEMBER 2007

ABSTRACT

Currently there are limited web based environment that is capable of adapting to mobile device user agents such as mobile phone, PDA or automobile Internet devices. This is because most web content has been designed with personal computers in mind, with large colour screen and broadband internet access and the content often contain rich media while the mobile devices are subject to many limitations such as processing power, screen size, screen resolution, storage size, application supported, and network connection. Ensuring these devices getting the same information as good as and as reliable as personal computers is very challenging. Most of the existing server based adaptation architectures do not exploit the issues of availability, scalability and reliability. In this thesis we propose a novel server based content adaptation architecture using content switching technique suitable for handling a huge number of concurrent requests for uploading, transcoding and downloading video files. The proposed architecture has three main components - the web server, database and content switching device. A large amount of testing was conducted to prove that the network architecture is workable and able to achieve high computing performance with good network reliability and service availability. Through our experiment, we can conclude that using content switching technique, the amount of time for data to travel from mobile device to server is smaller for the process of uploading, transcoding and downloading video files. In addition, we have also proved that implementing content adaptation architecture using content switching technique can increase the number of concurrent client connections.

ACKNOWLEDGEMENTS

Immeasurable gratitude to Allah S.W.T. for giving me an opportunity and facilitate me in completing this dissertation and this master program.

A journey is easier when you travel together. Interdependence is certainly more valuable than independence. This dissertation is the result of one and a half year of study whereby I have been accompanied and supported by many people. It is a pleasant aspect that I have now the opportunity to express my gratitude for all of them.

In the first place I would like to record my gratitude to my supervisor, Mr. Mohd Faisal Ibrahim for his supervision, advice, and guidance from the very early stage of this dissertation as well as giving me extraordinary experiences through out the work. Above all and the most needed, he provided me unflinching encouragement and support in various ways. Without his help, this work would not be possible. I would also like to thank all my lecturers for this program Mr Farok Azmat, Tuan Haji Jamaluddin Md Yusof, Mr. Kamarul Ariffin Abdul Basit, Mr. Kamarularifin Abd Jalil, Mr. Mohd Izani Mohamed Rawi, Mr. Kamaruddin Mamat, and Assoc. Prof. Dr Othman Ismail for all the information, support and helpful motivation during my study.

I would like to express my appreciation to my beloved wife

whose dedication, love and persistent confidence in me, has taken the load off my shoulder. I owe her for being unselfishly let her intelligence, passions, and ambitions collide with mine. I feel sorry to my beloved son for not always be there when he need it, due to the need of my attention for this study. Alhamdulillah, and thank you so much to Allah for 'anugerah', my cute daughter although it was only for 7 days.

I wish to thank my in-law parents,

who have always believed in me, helped and supported me to complete this program. Thank you so much for willingly sharing my responsibilities during this entire program. I owe them everything and wish I could show them just how much I love and appreciate them.

TABLE ON CONTENT

CHAPTER I.....	8
INTRODUCTION.....	8
1 Introduction.....	8
1.1 Problem Statement.....	10
1.2 Research Questions.....	12
