ABSTRACT

Serious games is a games that have ability to motivate behavior in serious context, in which can change the attitudes, behaviors and habits of players. To create obesity awareness, the existing serious games are available but they are lacking of information, in which not taking an account of importance in giving the feedback or knowledge during gameplay, that can change behavior or habit of obese people. The authors investigate situation awareness model and behavioral change model in understanding the process in achieving awareness. Besides, the authors also exploring an important serious game elements in term of storyline, gameplay, interface and visualization that can help players in achieving their awareness. The authors also investigate recommendation technique which includes content-based filtering techniques, collaborative filtering technique and hybrid filtering technique to be implemented in serious games in order to raise obesity awareness. In addition, the development and testing of the games are also been explained. Both results from control group testing and experimental group testing are discussed and compared.

ACKNOWLEDGEMENT

Firstly, I wish to thank Allah for giving me the opportunity to embark on my Master degree and for completing this long and challenging journey successfully. My gratitude and thanks go to my supervisor Dr. Marina Ismail who provided guidance in completing this project.

My appreciation goes to Dr. Noraini Seman who provided assistance in completing this project report. Special thanks to my colleagues and friends for helping me with this project.

Finally, this thesis is dedicated to my father and mother for the vision and determination to educate me. This piece of victory is dedicated to both of you. Alhamdulillah.
