ABSTRACT

When Telekom Malaysia (TM) introduces Wi-Fi residential gateway to its broadband customer, TM faces the issues of Wi-Fi signal strength and Wi-Fi network performance. The convenience of wireless connectivity has increased the usage of wireless devices such as mobile phone, smart TV, tablet, wireless speaker and CCTV. The problems with wireless residential gateway arise when there is multiple access point nearby which potentially reduce the Wi-Fi network performance. These access points can cause signal interference between access points if the selected channel are the same or overlapping. Even when the signal strength is high, interference from other nearby access points that uses overlapping channel or same channel can cause degraded network performance. This congested environment is not conducive for Wi-Fi connectivity and degrades the Wi-Fi performance in term of data transmission. This research, propose a new algorithm to find the least congested channel for WiFi environment to minimize the incidence of congestion-on WiFi access point (AP). This study has design channel scoring algorithm using Link Score Method, whereby the channel with the highest score were selected as least congested channel (LCC). There are five main aspects used as an input in calculating the Link Score. The five are the channel priority, RSSI, adjacent-channel, co-channel and weighted parameters. The algorithm can run on client devices such as wireless laptop, tablet and mobile phone. Once the algorithm suggested the least congested channel, TM customer shall be able to switch to the channel and expect this will reduce the signal interference and increase network performance. Testing results shows that the new algorithm are able to find least congested channel and suggested better channel compared to auto channel selection implemented by ten different access point model use in this study. All ten access point model used in the experiment are currently supplied by TM to the customers.

Keyword

Least congested channel, adjacent-channel, co-channel, received signal strength indicator, Wi-Fi, channel interference.

ACKNOWLEDGEMENT

First and foremost, the deepest gratitude of all shall be bestowed to Allah the Almighty and The Merciful for all the insight which He gave to us that lead to the completion of this research. Without His blessings and consent, I might not have enough courage and determination to complete this research. All my thanks and appreciation will be lay upon Him.

My deepest gratitude is extended to Dr Jasber Kaur A/P Gian Singh, for all assistance, advice, guidance, encouragement, new ideas and invaluable support given as my project supervisor for a better quality in my research. Thank you for being such a great mentor.

Not forgetting very special thanks to all staff of Telekom Research and Development Sdn Bhd (TMRND), MAST project Team, Project Leader Dr Tajuddin and all the lecturers, friends also colleagues of Master Science (Information Technology) for their support and encouragement during the process of completing this research.

Finally, I would like to express my deepest gratitude to my beloved parents and families, for all support and courage towards my success. Without their personal sacrifices and being a constant source for encouragement, especially in the final stages, this thesis would not have been possible.

Thank You.

TABLE OF CONTENTS	v
LIST OF TABLES	viii
LIST OF FIGURES	ix
LIST OF ABBREVIATIONS / NOMENCLATURE	x

CHAPTER ONE: INTRODUCTION

1.1	Introduction	1
1.2	Research Background	2
1.3	Problem Statement	3
1.4	Research Question	4
1.5	Research Objective	4
1.6	Research Scope	5
1.7	Research Significance	5
1.8	Organization Of Research Report	6

CHAPTER TWO: LITERATURE REVIEW

2.1	WiFi Network	7
2.1.1.	Infrastructure network	7
2.1.2.	Ad-Hoc network	8
2.1.3.	Channel Information	8

2.2	WiFi Channel Congestion	9
2.3	WiFi Interference Factors	10
2.3.1.	Physical Object interference	10
2.3.2.	Radio Frequency (RF) Interference	11
2.3.3.	Electrical Interference	11
2.3.4.	Environmental Factors	11
2.4	Received Signal Strength Indicator	12
2.5	Access Point (AP) Interference	13
2.6	Existing WiFi Channel Management Solutions	14
2.6.1.	Centralized Channel Assignment	14
2.6.2.	Distributed Channel Assignment	15
2.7	WiFi Channel Selection Method	17
2.7.1.	Least Congested Channel Search	17
2.7.2.	Weighted Coloring Approach	17
2.7.3.	Channel Hopping Approach	18
2.7.4.	MinMax Approach	18
2.7.5.	Link Scoring Method	19

CHAPTER THREE: METHODOLOGY

3.1	Research Paradigm And Approach	20
3.2	Research Design	20
3.2.1.	Research Framework	20
3.3	Research Process	21
3.4	Proposed Solutions	23
3.4.1.	Proposed Design	23
3.4.2.	Channel Priority	24
3.4.3.	Recieved Signal Strength Indicator (RSSI)	25
3.4.4.	Adjacent-Channel	27
3.4.5.	Co-Channel	27
3.4.6.	Weighted	28
